## ABSTRACT

Ovarian cancer is the leading cause of death from gynecologic cancers. The ten year survival is less than 30% and has not improved significantly over the last 30 years. We employed next generation sequencing to address three common areas where previous studies have been lacking and insight into disease etiology would help improve survival and treatment of patients with ovarian cancer. Firstly, one of the challenges to improved diagnostic and therapeutic intervention in ovarian cancer has been a limited understanding of the natural history of the disease. It has been proposed that fallopian tube cancers may be precursors of high-grade serous ovarian carcinoma (HGSOC) but evolutionary evidence for this hypothesis has been limited. We performed whole exome sequence and copy number analyses of laser-capture microdissected fallopian tube lesions (p53 signatures, serous tubal intraepithelial carcinomas (STICs), and fallopian tube carcinomas), ovarian cancers, and metastases from nine patients. Secondly, to improve our understanding of ovarian cancer, we performed genome-wide analyses of 45 commonly used ovarian cancer cell lines. Lastly, endometrioid and mucinous ovarian cancers represent nearly a quarter of ovarian cancers and their molecular characteristics and pathologic origins are poorly understood. Whole exome sequencing analyses of HGSOC samples demonstrated that p53 signatures and STICs are precursors of ovarian carcinoma and identified a window of seven years between development of a STIC and initiation of ovarian carcinoma, with metastases following rapidly thereafter. Whole genome sequencing analyses of 45 ovarian cancer cell lines showed dose-response analyses to targeted therapies revealed unique molecular dependencies, including increased sensitivity of tumors with PIK3CA and PPP2R1A alterations to PI3K inhibitor GNE-493, MYC amplifications to PARP inhibitor BMN673, and SMAD3/4 alterations to MEK inhibitor MEK162. Finally, whole exome and genome sequencing analyses on less common ovarian cancer subtypes revealed ovarian and GI mucinous tumors were epigenetically distinct. In contrast, the number of alterations and affected genes in ovarian and uterine endometrioid cancers were not distinguishable, suggesting

that these tumors may have a similar tissue of origin. Together these analyses provide insights into the etiology of ovarian cancer, have implications for prevention, early detection and therapeutic intervention of this disease.

**Thesis Readers: Dr. Robert B. Scharpf, Ph.D. and Dr. Valsamo Anagnostou, M.D., Ph.D.**

## ACKNOWLEDGEMENTS

I would like to thank my mentor, Victor Velculescu, for his guidance and support throughout my graduate training, for his impeccable attention to detail, for always having time to discuss data, for his unwavering kindness, and for his efforts towards making the lab a warm and exciting environment. I also want to thank Robert Scharpf, Valsamo Anagnostou, and Dan Arking for their mentorship and advice as members of my thesis committee and beyond, and all the members of the Cancer Genomics Lab for their comradery. My family has also been a constant area of support, my husband, Kenny, and our three furbabies who has been with me through the highs and lows and always been a great source of encouragement and inspiration, my sisters, Charlotte and Alexis, and their whole families who have provided me many laughs and nephews to keep me sane and happy, my parents and new parents who I wouldn't be here without them, and finally my friends and labmates who have provided laughs and inspiration along the way. I greatly appreciate the contributions to research from patients with cancer as well as the support of Johns Hopkins University School of Medicine.

## CHAPTER 1:

### INTRODUCTION

## 1.1 Overall introduction

Ovarian cancer is the leading cause of death from gynecologic cancers<sup>1,2</sup>. The ten year survival is less than 30% and has not improved significantly over the last 30 years<sup>3</sup>. Despite significant efforts, various screening and therapeutic strategies have generally not led to improved overall survival<sup>4,5</sup>. One of the major challenges to improved diagnostic and therapeutic intervention in ovarian cancer has been a limited understanding of the natural history of the disease. Ovarian carcinoma is a highly heterogeneous group of diseases including different histological subtypes with distinct clinicopathological and molecular genetic features that can be generally classified as Type I and Type II tumors<sup>6</sup>. Among them, high grade serous ovarian carcinoma (HGSOC, the major Type II tumor) is the most common histologic subtype of ovarian cancer, accounting for three quarters of ovarian carcinoma<sup>7-10</sup>.

Despite significant advances in therapies for other solid tumor malignancies, the overall survival of patients with late-stage ovarian cancer has remained dismal with few new options for treatment. The standard therapy involves debulking surgery followed by chemotherapy. Part of the reason for the lack of novel therapies for ovarian cancer has been an inadequate understanding of the underlying molecular characteristics of this disease, especially in the context of cancer cell models than can facilitate the development of various cancer treatments.

Epithelial ovarian cancer comprises about 90% of all ovarian cancer malignancies and includes high grade serous, low grade serous, mucinous, endometrioid and clear cell ovarian carcinoma. High grade serous ovarian cancers (HGSOC) represent more than half of all epithelial ovarian cancers and is the most widely studied epithelial ovarian tumor, while endometrioid and mucinous account for 10% and 6%, respectively<sup>11</sup>. Through extensive whole genome, exome, and methylation analyses of HGSOC, a variety of genes have been identified as likely drivers in these tumors<sup>12</sup>, and evolutionary analyses have implicated the fallopian tube as the tissue of origin of

HGSOC<sup>13-15</sup>. Apart from alterations in a few well known drivers including *KRAS* and *HER2* amplification in ovarian mucinous carcinomas and mutations in *ARID1A*, *PIK3CA*, and *PTEN* genes as well as MMR deficiency in ovarian endometrioid carcinomas, comparatively little is known about molecular alterations in these tumors. Comprehensive genomic analyses of these tumor subtypes could delineate additional alterations and pathways frequently altered in these cancers and shed light on their likely tissue of origin.

## **1.2 High grade serous ovarian carcinomas originate in the fallopian tube introduction**

Genomic analyses of HGSOC have identified genetic alterations in *TP53*, *BRCA1*, *BRCA2*, *PTEN* and other genes although few of these discoveries have affected clinical care<sup>16,17</sup>. HGSOC is diagnosed at advanced stages in approximately 70% of cases, and these women have a significantly worse outcome than those with early stage disease. Until recently, the prevailing view of HGSOC was that it developed from the ovarian surface epithelium. However, early *in situ* lesions that arise from the ovarian surface epithelium and progress to invasive HGSOC have never been reproducibly identified.

Insights into the pathogenesis of HGSOC have emerged from investigating the prevalence of occult ovarian and fallopian tube carcinomas in women with germline mutations of *BRCA1/BRCA2* genes<sup>18-22</sup>. Potential precursor lesions of HGSOC were identified in the fimbriae of the fallopian tubes removed as part of prophylactic surgery<sup>21</sup>. Such lesions, including a *TP53* mutant single-cell epithelial layer (p53 signature) and serous tubal intraepithelial carcinoma (STIC)<sup>22,23</sup>, have been identified in patients with advanced stage sporadic HGSOC of the ovary, fallopian tube and peritoneum<sup>23</sup>. Immunohistochemical as well as targeted sequencing analyses have shown that fallopian tube lesions harbor the same *TP53* mutation as surrounding invasive carcinomas<sup>22-26</sup>. These analyses suggest a clonal relationship among such tumors but given the limited number of genes analyzed do not conclusively identify the initiating lesions nor exclude the possibility of

fallopian tube metastases from primary ovarian carcinomas<sup>26,27</sup>. Yet additional studies have evaluated clonal intraperitoneal spread of ovarian cancer using whole genome analyses, but this effort did not analyze precursor lesions such as STICs that may give rise to this disease<sup>28</sup>.

In this study, we use exome-wide sequence and structural analyses of multiple tumor samples from the same individual to examine the origins of HGSOC. We have previously shown that the acquisition of somatic alterations can be used as a molecular marker in the development of human cancer<sup>29</sup>. Here, we examine whether the compendium of somatic alterations identified in different lesions may provide insights into the evolutionary relationship between primary fallopian tube lesions, including p53 signatures and STIC lesions, ovarian carcinomas, and intraperitoneal metastases.

### **1.3 Integrated genomic, epigenomic and expression analyses of ovarian cancer cell lines introduction**

Recent studies have highlighted the genomic complexity and heterogeneity of ovarian cancer. These have included a catalog of sequence mutations, focal changes in DNA copy number, gene expression, and methylation alterations in high grade serous ovarian cancer<sup>16</sup> as well as whole exome analyses of ovarian clear cell carcinoma and low grade serous carcinoma<sup>30,31</sup>. Genome-wide sequence analyses of high grade serous ovarian cancer identified drivers associated with primary and acquired resistance to chemotherapy<sup>13,17</sup>. More recently, a catalog of proteomic alterations in high grade serous TCGA samples has been integrated with structural alterations and correlated with clinical outcomes<sup>32</sup>. Hypothesis-generating pharmacogenomic studies involving cancer cell lines, some of which were ovarian, have revealed genetic- and expression-based alterations associated with resistance or sensitivity to a panel of drugs<sup>33,34</sup>. More recent cell line studies have evaluated high grade serous, clear cell and other cancers using targeted genomic and other molecular analyses<sup>35-37</sup>. These initial efforts were extended to demonstrate the similarity of molecular

alterations in cell lines to those in corresponding tissues, to develop approaches for incorporating multiple data types to model sensitivity, and to apply these models to larger drug panels<sup>38</sup>. Despite these advances, a comprehensive analysis of genome-wide structural alterations, including intra- and inter-chromosomal translocations and gene fusions, and integration of these data with whole-exome sequence, epigenetic and expression information are not available for many histological subtypes of ovarian cancer. Furthermore, the therapeutic response of these ovarian cancer subtypes to common targeted therapies is not well understood.

Here, we performed complementary molecular analyses of 45 ovarian cell lines of different histologies, including serous, clear cell, endometrioid, and mucinous cancers. As these cell lines do not have matched normal tissues, we developed novel approaches to characterize tumor-specific alterations at sequence and structural levels, and integrated these with methylation and transcript changes to identify the compendium of alterations at the gene- and pathway-levels. Using the same cell lines, we evaluated the effect of a few targeted agents of common pathways using in vitro cell survival assays. Our analyses identified novel molecular alterations in ovarian cancer, delineated genes modulated by genetic and epigenetic changes, and highlighted specific sequence, structural, and epigenetic alterations associated with sensitivity and resistance to common pathway inhibitors.

#### **1.4 Genomic landscapes of endometrioid and mucinous ovarian cancers introduction**

Accumulating evidence suggests connections between endometrioid ovarian cancers and endometrioid uterine tumors, which accounts for nearly 85% of all epithelial uterine carcinomas<sup>39</sup>. Synchronous endometrioid ovarian and uterine carcinomas can arise from independent primary tumors or as metastases from a single primary tumor<sup>40,41</sup>, suggesting that these tumors may share the same cell of origin<sup>42,43</sup>. Women who have synchronous ovarian and uterine cancers have an improved survival as compared to those with a single cancer, in part due to early diagnosis from

the symptoms associated with uterine tumors <sup>44</sup>. Understanding the origin of these cancers could lead to more accurate prognoses of survival or more aggressive early intervention. While whole genome and targeted next generation sequencing analyses have been performed of ovarian endometrioid carcinomas <sup>45,46</sup> and whole exome studies have been performed on uterine endometrioid carcinomas <sup>47</sup>, the extent to which these cancers share similar alterations and a potentially common tissue of origin has not been systematically evaluated.

Distinguishing between primary mucinous ovarian cancer and mucinous adenocarcinoma metastases from other sites, including gastrointestinal mucinous tumors, may be challenging. Some histological features can favor primary diagnosis but there are several discordant and overlapping features that make a definitive diagnosis difficult <sup>48</sup>. Genomic analyses for mucinous ovarian and gastrointestinal cancers, including pancreatic, stomach and colorectal cancer, have largely been limited to targeted sequencing <sup>49-52</sup>. Additionally, no studies to date have compared the genomes and epigenomes of mucinous carcinomas from the ovary with those of other sites. Such analyses could establish the tissue of origin and lead to better risk stratification and treatment for patients with these cancers.

To better understand the genomic landscapes of these ovarian cancer subtypes and their histological counterparts, we performed whole exome sequencing and/or whole genome sequencing of 130 samples from 117 patients with endometrioid cancer of the ovary or uterus or mucinous cancer of the ovary or GI tissues (stomach, pancreas, or colon). Whole exome sequencing analyses identified somatic sequence mutations and structural alterations common to these cancers, including deletions, amplifications, and loss of heterozygosity. For samples with whole genome sequencing, we additionally identified novel intra- and inter-chromosomal rearrangements and in-frame fusions using our recently developed Trellis approach <sup>53</sup>. To further explore the differences in molecular landscapes of mucinous cancers, we compared the epigenome of 25 patients with ovarian or GI

mucinous cancer using genome-wide methylation analyses in both the cancer and adjacent normal tissues. These analyses highlight major pathways affected by genomic and epigenomics changes in these ovarian cancers, and identified a number of novel molecular alterations that may improve our understanding of their tissue of origin.

## CHAPTER 2:

# HIGH GRADE SEROUS OVARIAN CARCINOMAS ORIGINATE IN THE FALLOPIAN TUBE

## METHODS

### **Specimens obtained for sequencing analysis**

The study was approved by the Institutional Review Board at Brigham and Women's Hospital and the Johns Hopkins Hospital and all patients gave informed consent before inclusion. Five sequential patients with stage III sporadic HGSOE, in whom a serous tubal intraepithelial carcinoma (STIC) was identified in their fallopian tubes (FT), were included. In addition, we included isolated STICs from three patients with germline BRCA deleterious mutation alterations who underwent prophylactic bilateral salpingo-oophorectomy and as well as a fourth patient who had bilateral salpingo-oophorectomy and hysterectomy in the context of a pelvic mass. All cases underwent complete tubal examination using the SEE-FIM protocol<sup>16</sup>. Formalin-fixed paraffin embedded (FFPE) blocks were retrieved from the pathology files at Brigham and Women's Hospital and Johns Hopkins Hospital within the 3 months following surgical diagnosis and stored at 4°C to slow down nucleic acids degradation. All the cases were reviewed by a gynecologic pathologist (MH, DL, LS) that confirmed the diagnosis of STIC and /or p53 signature in the FT. Slides from each FFPE block were microdissected, including early lesions, invasive carcinomas and metastases, stained with Hematoxylin & Eosin (H&E), and using immunohistochemistry were analyzed for p53 staining. In each FT, at least one STIC and/or p53 signature was identified and microdissected separately. Importantly, STICs were not pooled together even if they were in the same section. They were considered separate STICs.

### **Immunohistochemistry p53 staining for and laser capture microdissection**

For accurate microdissection of early lesions including STIC and p53 signature, immunohistochemistry staining of p53 was specifically adapted for Laser Capture Microdissection

(LCM) as previously described<sup>43</sup>. PEN membrane frame slides Arcturus (Life technologies, Carlsbad, CA) were used. Each slide was coated with 350  $\mu$ l of undiluted poly-L-lysine 0.1% w/v (Sigma, St. Louis, MO). For drying, the slides were placed in a slide holder for 60 minutes at room temperature. Tissue sections were cut and mounted on the pretreated membrane slides. Deparaffinization was performed in fresh xylene for 5 minutes twice, followed by 100% ethanol for 2 minutes, 95% for ethanol 2 minutes and 70% ethanol for 2 minutes. Subsequently, the slides were transferred into distilled water for 5 minutes. Heat-epitope antigen retrieval (AR) was performed in Citrate Buffer (Dako, Carpinteria, CA) at low temperature (60°C) for 44 hours instead of 120°C for 10 minutes to reduce tissue and DNA damage by high temperature. Retrieval solution was pre-warmed to 60°C before usage. After incubation in the oven, the AR solution was left to cool down to room temperature and the slides were rinsed for 30 seconds in fresh 1X PBS then incubated for 40 minutes with primary antibody anti-p53 (Epitomics, Burlingame) at 1:100 in a humidifying chamber. Before adding the secondary antibody, slides were washed twice for 1 minute in fresh 1X PBS. The secondary antibody, labeled polymer-HRP anti-mouse (Dako EnVision System-HRP (DAB), Carpinteria, CA) was applied for 30 minutes. Then, slides were washed twice for 1 minute in fresh 1X PBS. Chromogenic labeling was performed with 3,3-DAB substrate buffer and DAB chromogen (Dako EnVision System-HRP (DAB), Carpinteria, CA) for 5 minutes. Slides were washed again for 30 seconds in fresh distilled water. Dehydration was performed as follows: 70% ethanol for 30 seconds, 95% ethanol for 30 seconds, 100% ethanol for 30 seconds, and xylene for 30 seconds. The stained slides were microdissected within 2 hours with the Arcturus XT LCM system (Life technologies, Carlsbad, CA).

### **Hematoxylin staining for laser capture microdissection**

Invasive carcinomas from the ovaries, the fallopian tubes and intraperitoneal metastases or STICs from patients with negative p53 IHC staining were microdissected after Hematoxylin staining.

Briefly, deparaffinization was performed in fresh xylene for 1 minute twice followed by 100% ethanol for 1 minute, 95% for ethanol 1 minute and 70% ethanol for 1 minute. The slides were transferred into distilled water for 2 minutes before staining with Hematoxylin for 2 minutes. Subsequently, slides were rinsed in distilled water until they became clear before undergoing dehydration in 70% ethanol for 1 minute, 95% ethanol for 1 minute, 100% ethanol for 1 minute and xylene for 1 minute. The stained slides were microdissected within 2 hours.

### **Sample preparation and next-generation sequencing**

DNA was extracted from patient whole blood using a QIAamp DNA Blood Mini QIAcube Kit (Qiagen Valencia, CA). Genomic DNA from FFPE blocks was extracted from the microdissected tissues using the QIAamp DNA FFPE Tissue kit (Qiagen, Valencia, CA). In brief, the samples were incubated in proteinase K for 16 hours before DNA extraction. The digested mixture was transferred to a microtube for DNA fragmentation using the truXTRAC™ FFPE DNA Kit with 10 min shearing time as per the manufacturer's instructions (Covaris, Woburn, MA). Following fragmentation, the sample was further digested for 24 hours followed by one hour incubation at 80°C. DNA purification was performed using the QIAamp DNA FFPE Tissue kit following the manufacturer's instructions (Qiagen, Valencia, CA). Fragmented genomic DNA from tumor and normal samples were used for Illumina TruSeq library construction (Illumina, San Diego, CA) according to the manufacturer's instructions or as previously described<sup>44</sup>. Exonic or targeted regions were captured in solution using the Agilent SureSelect v.4 kit or a custom targeted panel according to the manufacturer's instructions (Agilent, Santa Clara, CA). Paired-end sequencing, resulting in 100 bases from each end of the fragments for exome libraries and 150 bases from each end of the fragment for targeted libraries, was performed using Illumina HiSeq 2000/2500 and Illumina MiSeq instrumentation (Illumina, San Diego, CA).

## **Next generation sequencing data and identification of somatic mutations**

Somatic mutations were identified using VariantDx45 custom software for identifying mutations in matched tumor and normal samples. Prior to mutation calling, primary processing of sequence data for both tumor and normal samples were performed using Illumina CASAVA software (v1.8), including masking of adapter sequences. Sequence reads were aligned against the human reference genome (version hg18 or hg19) using ELAND. Candidate somatic mutations, consisting of point mutations, insertions, and deletions were then identified using VariantDx across the either the whole exome or regions of interest44. For samples analyzed using targeted sequencing, we identified candidate mutations that were altered in >10% of distinct reads. For samples analyzed using whole exome sequencing, we identified candidate mutations that were altered in >10% of distinct reads with  $\geq 5$  altered reads in at least one sample, where coverage at the altered base was at least as high as the TP53 alteration in that sample, and where the ratio of the coverage of the mutated base to the overall sequence coverage of that sample was >20%. Identified mutations were reported as present in other samples of the same patient if the mutation was present in at least 2 distinct altered reads. Mutations present in polyN tract  $\geq 5$  bases, or those with an average distinct coverage below 50x were removed from the analysis.

An analysis of each candidate mutated region was performed using BLAT. For each mutation, 101 bases including 50 bases 5' and 3' flanking the mutated base was used as query sequence (<http://genome.ucsc.edu/cgi-bin/hgBlat>). Candidate mutations were removed from further analysis, if the analyzed region resulted in >1 BLAT hits with 90% identity over 70 SCORE sequence length. All candidate alterations were examined by visual inspection, and any alteration present.

## **Genome-wide allelic imbalance analysis**

We performed comparative analysis of loss of heterozygosity (LOH) across the tumor samples from each patient to identify copy number alterations occurring in the course of tumor evolution. Minor allele frequency (MAF) of germline heterozygous SNPs with minimum coverage of 10x in each tumor sample were segmented using circular binary segmentation algorithm (CBS)<sup>46</sup>. Genomic segments where the difference between tumor and normal MAF exceeded a threshold of 0.10 were labeled as harboring LOH. In each tumor sample, the minimum MAF across segments with minimum size of 10 Mb was calculated to provide a measure of sample purity. Each segment marked as LOH was assigned to one of the three confidence categories: (1) High confidence, segment MAF within 0.1 of the minimum sample MAF. (2) Intermediate confidence, segment MAF within 0.1 to 0.2 of the minimum sample MAF (3) Low confidence, segment MAF exceeding the minimum sample MAF by greater than 0.2.

Next, sample level segments were intersected across the entire set of samples from each patient to derive patient level segments while accounting for the possibility of variable segment break points in different samples (Supplementary Data 7-11). Patient level segments were filtered to keep those covering a minimum of 20 SNPs and with minimum length of 10 Mb. The resulting segments were further narrowed down to only include those with high confidence LOH in at least one of the samples. Genomic segments with LOH in a subset of samples can serve as informative markers to track tumor evolution similar to somatic mutations. To increase the specificity in identifying this class of genomic segments, we required a minimum distance of 0.1 between the MAF of samples with and without LOH. To minimize the possibility of over-segmentation which could result in inflated estimates of the number independent structural alterations, we evaluated patient level segments with boundaries within a 5 Mb window. In cases where the LOH calls were identical and the difference of segment minor allele frequencies were less than or equal to 0.05 in all tumor samples, the segments were merged.

For CGOV62 and CGOV63, the number of germline heterozygous SNPs meeting the coverage criteria in p53 signature samples was significantly lower than the other samples from the same patient. Thus, we modified the approach above in these two patients to enable sensitive analysis of LOH in p53 signature samples. Initially, the patient level genomic segments of interest were defined excluding p53 signature samples. Next, in each genomic segment, the minor allele of each overlapping germline SNP was determined by taking a majority vote over their minor alleles in the other samples. The coverage and minor allele read count for each SNP was derived using samtools (v0.1.19) mpileup module<sup>47</sup>. The segment minor allele frequency in p53 signature samples were calculated by dividing the sum of minor allele read counts across all SNPs by the total coverage of SNPs, circumventing the variance resulting from low coverage at individual SNPs. In each p53 signature sample, segments with MAF lower than that of the normal by at least 0.1 were marked as LOH.

### **Copy number analysis**

The genome-wide copy number profiles were determined by analysis of the ratio of read counts in the tumor and matched normal whole exome sequenced samples. In each sample, the number of reads mapping to genomic bins located in target and off-target regions were corrected for biases arising from GC-content, repetitive sequences, and target capture process using CNVKit (v.0.7.6) [<https://doi.org/10.1371/journal.pcbi.1004873>]. The log ratio of the processed tumor to normal read counts provides a measure of copy number in each bin, and was segmented to yield genomic intervals at constant copy number levels. The difference in sequencing library size between the tumor and normal samples is another factor that needs to be accounted for when analyzing reads ratios in NGS-based copy number pipelines. In CNVKit, the log ratio values in each sample are adjusted by setting the median of autosomal bins to 0 in log space, assuming a median ploidy of 2

for the genome. Given the high prevalence of copy number aberrations in ovarian cancer and the high frequency of allelic imbalance in the present cohort, this assumption may not be accurate, and will manifest itself as a genome-wide bias or shift of log ratio values.

Therefore, an alternative approach for normalization of log ratio values was adopted, which takes into account the level of allelic imbalance in each genomic region. Briefly, genomic regions with the least degree of allelic imbalance were identified in each tumor sample, and used in a normalization process based on the notion that these regions can only be present in an even number of copies. The distribution of log ratio values among these regions was inspected to ensure that they belong to the same copy number level. Otherwise, a subset of regions at a common log ratio (and thus copy number) level were selected. By fixing the copy number of these segments at a specified level, one can solve for the genome-wide bias of log ratio values as follows, and thus identify the genome-wide integer copy number profile.

$$R = \log_2 \left( \frac{\alpha CN_T + (1 - \alpha)CN_N}{2} \right) - \delta$$

In the equation above,  $R$  represents the observed log ratio of read counts,  $\alpha$  is the purity of the tumor sample,  $CN_T$  and  $CN_N$  are the integer copy number of tumor and normal samples at a locus, and  $\delta$  is the genome-wide bias term. Given the value of tumor purity and copy number,  $\delta$  is the only unknown in the equation. To favor solutions with less complex genomes, the copy number of regions with complete allelic balance was initially set to 2. If the resulting solution was deemed implausible (e.g. by implying chromosome or chromosome arm scale homozygous deletions), the copy number of regions with complete allelic balance was assigned to 4 and an alternative solution was found (Supplementary Figure 10).

Details of the genomic segments selected to solve for the genome-wide bias term  $\delta$  are as follows. In CGOV62, chromosomes 4 and 12 did not have allelic imbalance in any tumor samples. The solution assigning copy number two to these regions implied homozygous deletion of the p-arm of chrX in multiple samples; therefore, the simplest plausible solution assigned them to 4 copies. In CGOV63, chromosomes 6 and 15 did not have allelic imbalance in any of the tumor samples, and were assigned to 2 copies. No complete chromosome with absence of allelic imbalance across all tumor samples could be found in CGOV278. Therefore, four genomic regions with no allelic imbalance were selected for the normalization process above. These regions were chr8:38-69Mb, chr12:62-85Mb, chr18:7-19Mb, chr20:23-35Mb. The solution assigning these regions to 2 copies resulted in an implausible assignment of homozygous deletion to chr5:50-136Mb. Therefore, assignment of four copies to the selected regions results in the simplest solution. In CGOV279, two genomic regions were selected for the normalization procedure: chr5: 64-131Mb, chr20:17-36Mb. Evaluation of log ratio values suggested that the two regions are present at different copy levels, as evidenced by a difference of  $\sim 0.60$  in the log ratio values. The region on chr5, which had the lower log ratio level, was assigned to copy number 2. In CGOV280, chr16q had no allelic imbalance in any samples excluding the left FT STIC. Examination of log ratio values of chr16q in the left FT STIC supports a copy loss in that sample. The genome-wide bias term  $\delta$  was determined by assignment of 2 copies to chr16q in the four samples with no allelic imbalance, and one copy in the left FT STIC.

### **Subclonal hierarchy analysis**

The tumor subclonality phylogenetic reconstruction algorithm SCHISM 1.0.025 was used to infer tumor subclonal hierarchies from the set of confidently called somatic mutations in each patient. Given the estimates of genome-wide copy number profile, most copy number aberrations seem to occur early in the evolution of disease and are common across the lesions analyzed from each

patient. Thus, the majority of somatic mutations can be assumed to occur following the acquisition of copy number aberrations, and can be present in cancer cells with multiplicity of one (one mutated copy per cell). Using this assumption, we can estimate mutation cellularity (or cancer cell fraction) from the observed reference and alternate read counts, and estimates of copy number, and tumor purity as follows.

$$V_{exp} = \frac{m\alpha C}{\alpha CN_T + (1 - \alpha)CN_N}$$

In the equation above,  $V_{exp}$  is the expected variant allele frequency of the mutation,  $m$  is the multiplicity of the mutation which is set to 1,  $\alpha$  is the purity of the tumor sample,  $C$  is the cellularity of the mutation, and  $[[CN]]_T$  and  $[[CN]]_N$  are the integer copy number of tumor and normal sample at the locus of the mutation. The observed alternate read count of the mutation can be modeled as a binomial random variable drawn from a distribution with probability parameter equal to  $V_{exp}$  and number of trials equal to the total sequence coverage of the mutation. We calculated the likelihood for observation of the alternate read counts for cellularity values spanning the range of 0 to 1 in increments of 0.01, and derived the maximum likelihood estimate and confidence interval for the mutation cellularity.

To obtain reliable estimates of mutation cellularity, we clustered mutations by joint presence or absence across the available tumor samples. This approach makes phylogenetic reconstruction more tractable and the cellularity of the resulting clusters can be estimated with higher accuracy than that of individual mutations. For each patient, a mutation was called as present or absent in each of the available tumor samples (10 samples from CGOV62, 6 samples from CGOV63, 5 samples from CGOV280, 4 samples from CGOV279, and 3 samples from CGOV278). To call the mutation present, we used a minimum allele frequency of 2% and 2 distinct mutant reads. Mutation clustering was performed by a greedy algorithm. Tumor purity in each tumor sample was estimated

as the read count fraction of TP53 mutation in each patient. Each patient harbored a single distinct TP53 mutation that was present in all tumor samples, and we assumed the wild-type allele was lost, as supported by the ubiquitous LOH of chromosome 17. To derive a more comprehensive view of the evolution of these samples, we extended the original SCHISM framework to model acquisition of large scale somatic copy number alterations, which can be detected by analysis of allelic imbalance (including LOH). First, we extracted a set of high confidence genomic regions with ubiquitous, partially shared, or private LOH in tumor samples of each patient (Methods). These regions of LOH served as binary features that could be used for evolutionary analysis, and were clustered into LOH feature groups with identical patterns of presence or absence across samples (Figure 2). Each LOH feature group was compared to the somatic mutation clusters in each patient, with respect to its pattern of presence or absence across samples. In cases where a mutation cluster with the identical pattern could be found, the cluster and the LOH feature group were assumed to have occurred together in the course of tumor evolution. Otherwise, the LOH feature groups were modeled as distinct features, and added in post-hoc analysis by application of the lineage precedence rule from SCHISM; which requires cellularity of ancestor alterations to be greater than or equal to cellularity of descendant alterations in all tumor samples. SCHISM was run with the above inputs and default parameter settings to infer the order of somatic alterations and thus define subclonal hierarchy in each patient. SCHISM software is freely available for non-profit use at <http://karchinlab.org/appSchism>.

Evolutionary trees resulting from SCHISM analysis were compared with those derived by maximum parsimony phylogeny using PHYLIP (Phylip-3.695, PARS method). For CGOV280, an adjustment to the tree was applied to account for multiple subclones in Right FT STIC.

### **Estimating an evolutionary timeline**

Following the approach of Jones et al., the observed data are the number of somatic mutations in the STIC ( $n_j$ ), the number of mutations in the metastasis ( $n_k$ ), and the age at which the patient was diagnosed ( $t_k$ ), where somatic mutations include both sequence and structural alterations. Unknown is the birth date ( $t_j$ ) of the cell that was the last common ancestor of the STIC and the metastasis. Assuming the mutation rate of somatic passenger mutations and the length of the cell cycle is constant, the number of somatic mutations in the metastasis cell that were present in the STIC follows a binomial distribution with parameters  $N_2$  and probability  $t_j/t_k$ . As  $t_j$  is unknown, we posit a conjugate beta probability distribution on the rate  $t_j/t_k$  with shape parameters  $a$  and  $b$  estimated from previous studies as described below. The posterior distribution of  $t_j/t_k$  is beta ( $a + n_j$ ,  $b + n_k - n_j$ ) from which 90% highest posterior density intervals can be constructed with point estimates for the birthdate reported as the posterior mean. For simplicity, we refer to the highest posterior density as a confidence interval. To construct a prior for  $t_j/t_k$ , we draw on a previous study of four colorectal cancer patients<sup>29</sup> where a small number of additional passenger mutations were acquired by the cell that gave birth to the metastasis. On average, 95% of the mutations in the original adenocarcinoma were present in the metastases. We center the mean for the beta prior at 0.95 using shape parameters  $a = 34$  and  $b = 1.6$ . Our prior is equivalent to one patient having 34 passenger somatic mutations in the original lesion and 1.6 additional mutations to be acquired by cells that gave birth to the metastases. For patients with three samples in a linear tree as determined by evolutionary analyses (say, samples  $j$ ,  $k$ , and  $l$  where sample  $j$  is the STIC,  $l$  is the metastasis, and  $k$  is an intermediate sample), we first derived the posterior distribution for  $t_k$  comparing mutations in samples  $k$  and  $l$ . Next, we derived the posterior distribution of  $t_j$  integrating over all possible values of  $t_k$ , thereby fully incorporating the uncertainty of the intermediate timepoint in the estimate of  $t_j$ . We evaluated three additional prior models, and found that that posterior inference under these alternative models given by 90% credible intervals for  $t_k - t_j$ , results in qualitatively similar timelines among different lesions in tumor progression.

## RESULTS

### Overall approach

To elucidate the relationship among tumors in patients with HGSOC, we performed whole-exome sequencing of 37 samples from five patients diagnosed with sporadic HGSOC who underwent upfront debulking (Supplementary Table 2.1). This included STIC lesions, fallopian tube carcinomas, and ovarian cancers in all five patients; appendiceal, omental or rectal metastases in three of patients (CGOV62, CGOV280, CGOV278); p53 signatures in two patients (CGOV62, CGOV63); and a STIC lesion in the contralateral fallopian tube from the affected ovarian cancer (CGOV280).

In addition, we analyzed isolated STIC lesions from four patients (CGOV64, CGOV65, CGOV303 and CGOV304), three of whom had germline pathogenic *BRCA* alterations and underwent prophylactic bilateral salpingo-oophorectomy, and a fourth who had bilateral salpingo-oophorectomy and hysterectomy in the context of a pelvic mass (Supplementary Table 2.1). For all patients, laser capture microdissection was used to isolate lesions after immunohistochemistry (IHC) staining of p53 in STICs and p53 signatures if these contained a *TP53* missense mutation or after hematoxylin staining if the samples contained a *TP53* nonsense mutation (Figure 2.1). All other samples were microdissected after hematoxylin staining. Whole blood, normal ovarian stroma, normal fallopian tube stroma, or normal cervix were used as control samples.

To identify genetic alterations in the coding regions of these cancers, we used next-generation sequencing platforms to examine entire exomes in matched tumor and normal specimens of all patients (Figure 2.1). This approach allowed us to identify non-synonymous and synonymous sequence changes, including single base and small insertion or deletion mutations, as well as copy number alterations in coding genes. Given the challenges of exome-wide analyses of small tumor

samples observed in STICs and p53 signature lesions, we developed experimental and bioinformatic approaches for detection of somatic alterations from laser capture microdissected tissue. These included optimized approaches for microdissection of STICs and p53 signatures after immunohistochemical staining, improved DNA recovery from laser captured material, library construction from limited and stained tissue samples, and error correction methods in next generation sequence analyses. The analyses of p53 signatures were particularly challenging because these are extremely small lesions, representing 10-30 cells per section and less than several hundred cells total that result in minute amounts (less than a few ng) of isolated DNA. We optimized these approaches using a targeted next generation sequencing approach analyzing 120 genes in a subset of samples from patient CGOV62, and then used whole-exome analyses to evaluate coding sequence alterations in all samples (Supplementary Tables 2.2-2.4). We obtained a total of 719 Gb of sequence data, resulting in an average per-base sequence ~178-fold total coverage (~112-fold distinct coverage) for each tumor analyzed by whole-exome sequencing (Supplementary Table 2.2).

### **Analysis of sequence and structural changes**

Whole-exome sequence analyses of the tumor samples from each patient identified somatic mutations that were present in all neoplastic samples analyzed as well as specific changes that were present in individual or subsets of tumors (Figure 2.2). As expected, we identified sequence changes in the *TP53* tumor suppressor gene, a well-known driver gene in HGSOC, in all cases. The *TP53* alterations were identical in all samples analyzed for each patient including in the p53 signatures, the STIC lesions, and other carcinomas. These data suggest that mutation of *TP53* was among the earliest initiating events for high grade serous ovarian carcinoma development as all lesions harbored this alteration.

IHC staining for p53 did not identify any nuclear positive staining of p53 on the ovarian surface epithelium in any of the cases that had *TP53* missense mutation, whereas all carcinomas, STICs, and p53 signatures in the fallopian tube were positive. Whole-exome sequence analyses of normal ovarian stroma (no p53 staining) microdissected from three patients (CGOV64, CGOV65, CGOV280) did not find any genomic abnormalities. Analysis of the resected tissues revealed that none of the nine cases had ovarian inclusion cysts. These observations suggest that there is no early lesion with *TP53* mutation in the surface epithelium or other normal regions within the ovary.

Because *TP53* mutations are expected to be clonal and were all homozygous due to loss of heterozygosity (LOH) of the remaining wild-type allele (as determined in our subsequent allelic imbalance analyses), we used the mutant allele fraction of *TP53* in each sample to estimate tumor purity. We further analyzed sequence alterations in all samples with estimated tumor purities >50%, while four samples with tumor cellularities below this threshold (omental metastasis from CGOV279 and right ovarian tumor from CGOV278), or that were miliary carcinomas (rectal and sigmoidal metastases from CGOV63) were only analyzed for structural changes.

Using a high-sensitivity mutation detection pipeline, we identified an average of 33 non-synonymous and synonymous sequence alterations per tumor sample. Candidate alterations were evaluated across samples in an individual to determine if they were present in multiple neoplastic lesions or were unique to a particular sample. To allow for the possibility that a subclone may have developed in a tumor lesion prior to becoming a dominant clone at another location, we determined if genetic alterations that were present in one tumor were also present in a low fraction of neoplastic cells of other lesions. This method required high coverage of analyzed alterations in all samples and excluded potential artifacts related to mapping, sequencing or PCR errors, allowing specific detection of alterations present in  $\geq 1\%$  of sequence reads (see Methods for additional information).

The composition of sequence alterations was relatively similar among the affected lesions of each patient. For example, for CGOV62, the STIC lesion, fallopian tube carcinomas, left and right ovarian cancers, and all four metastatic lesions harbored a common set of somatic mutations (Figure 2.2). In CGOV63, CGOV279 and CGOV278, while most of the sequence alterations were the same among the tumors of each patient, a subset of mutations could distinguish the STIC lesions and fallopian tube carcinomas from ovarian cancers or intraperitoneal metastases.

Given the importance of chromosomal instability in HGSOC<sup>16</sup>, we extended our analyses to examine structural variation in the multiple tumors of each patient. We focused on regions of allelic imbalance that can result from the complete loss of an allele (LOH) or from an increase in copy number of one allele relative to the other. We divided the genome into chromosome segments and for each segment compared the minor allele (B-allele) frequency values in tumor and normal samples using the ~17,000 whole-exome germline heterozygous single nucleotide polymorphisms (SNPs) observed (Figure 2.3, Supplementary Figures 2.1-2.9 and Supplementary Tables 2.7-2.11). Overall, we observed that an average of ~26% (range 12% - 39%) of the genome had chromosomal imbalances in the samples analyzed (Figure 2.3).

Integration of sequence and structural alterations identified an average of 47 alterations per sample (range 21-74) (Figure 2.2). The combination of both types of alterations allowed robust genomic differentiation between STICs and ovarian cancers or metastatic lesions in all patients analyzed. In patient CGOV62, a loss of heterozygosity (LOH) of 9q (70.8 – 131.7 Mb) provided a clear difference between the STIC and all other carcinomas analyzed (Figures 2.2 and 2.3). Likewise, chromosomal changes in 7q were represented a distinguishing feature between the right STIC or right fallopian tube tumors and the remaining lesions (ovarian cancers, omental metastasis and left STIC) in CGOV280 (Figures 2.2 and 2.3). In patient CGOV279, multiple regions of allelic

imbalance were present in a STIC near the fallopian tube carcinoma, while these were absent in a STIC that was not adjacent to this lesion.

### **Evolutionary relationship of neoplastic lesions**

As somatic genetic alterations can be used to recreate the evolutionary history of tumor clones, we used the somatic sequence mutations and chromosomal alterations observed in each patient to determine the history of tumor clonal evolution. We employed a subclone hierarchy inference tool called SCHISM (SubClonal Hierarchy Inference from Somatic Mutations) which enables improved phylogenetic reconstruction by incorporating estimates of the fraction of neoplastic cells in which a mutation occurs (mutation cellularity)<sup>54</sup>. We estimated the cellularity of each mutation by correcting the observed allele frequencies for tumor purity and copy number levels. In addition to the observed structural alterations, this approach allowed us to use 213 synonymous and nonsynonymous somatic sequence alterations to construct the phylogenetic trees illustrated in Figure 2.4 and Supplementary Table 2.5.

A SCHISM tree node represents cells harboring a unique compartment of mutations defining a subclone whereas an edge represents a set of mutations acquired by the cells in the progeny nodes that distinguish them from the cells in the parental node. By definition, for an individual cancer there could only be one parental clone, although there could be many different progeny subclones representing invasive or metastatic lesions or further evolution of the primary tumor. The optimal hierarchy among subclones is determined by examining all possible pairwise relationships between somatic alterations, and performing a heuristic search over the space of phylogenetic trees to identify the simplest model that can explain the observed alterations.

In all samples, the SCHISM analysis of sequence and structural alterations suggested that the p53 signature or STIC lesions contained the ancestral clone for the observed cancers (Figure 2.4). This

evolutionary relationship was strengthened by the observation that nearly all of the alterations within the p53 signature and STIC lesions were shared by all other lesions. For example, the ovarian tumors of all cases displayed alterations that were shared in fallopian tube lesions but also contained additional changes, suggesting that these represented daughter clones of the latter tumors (Figure 2.2). Likewise, the ovarian cancers or their immediate precursors were likely the direct parental clones for the metastases in CGOV62, CGOV278 and CGOV280 as demonstrated by the shared alterations that were not contained in earlier fallopian tube lesions. Overall, the phylogenetic model generated by these data suggests a progression from fallopian tube epithelium to p53 signatures and to STIC lesions which are then precursors of fallopian tube carcinoma, ovarian carcinoma, and metastatic lesions. In addition to the sequential accumulation of alterations in this linear evolution, we also observed branching phylogenetic trees due to continued evolution within STIC lesions as well as fallopian tube carcinomas and ovarian carcinomas (Figure 2.4). We compared evolutionary trees resulting from SCHISM analysis with those derived by maximum parsimony phylogeny using PHYLIP and the results were similar in all cases (Figure 2.4 and Supplementary Data 2.11).

Interestingly, patient CGOV280 had a right STIC, a right fallopian carcinoma, and a right ovarian cancer but also had a STIC in the left fallopian tube (Supplementary Figure 2.5). In this case the SCHISM analysis suggested that the lesion in the left fallopian tube which was pathologically determined to be a STIC actually represented a metastatic lesion of the right ovarian cancer (Figure 2.4). This lesion shared nearly all the alterations of the ovarian cancer but contained 10 single base substitutions and four additional regions of allelic imbalance on chromosomes 1, 13 and 22, and both the left STIC and right ovarian cancer had an additional region of allelic imbalance on chromosome 7 that was absent in the right STIC. These observations are consistent with the above model of STIC to ovarian cancer progression, but suggest that in advanced disease ovarian cancers

may also seed metastatic deposits throughout the peritoneum, including to the fallopian tube on the contralateral side.

### **Genomic alterations in isolated STICs**

Neoplastic cells observed in the fallopian tubes rather than the ovaries removed from carriers of germline mutation of *BRCA1* and *BRCA2* provided the first indication of the fallopian tube as a potential cell of origin of HGSOC<sup>20,55</sup>. Since less than 1.25% of HGSOC are diagnosed with stage I disease<sup>27</sup>, *BRCA* carriers provide a unique opportunity to analyze genomic alterations in isolated STICs without associated HGSOC. We examined neoplastic samples from three individuals with germline *BRCA* alterations where STIC lesions were incidentally identified after prophylactic bilateral salpingo-oophorectomy, and one patient where two STICs were identified after resection of pelvic mass (Supplementary Table 2.1). We identified *BRCA1* or *BRCA2* sequence alterations or deletions in the germline of three of these patients (*BRCA1* Q1200X, *BRCA2* L2653P, and a *BRCA2* 55kb hemizygous deletion in CGOV65, CGOV64, and CGOV304, respectively), as well as somatic mutations in *TP53*, and LOH of both chromosome 13 and 17, encompassing the *BRCA1*, *BRCA2* and *TP53* loci in all of these cases (Supplementary Figures 2.6, 2.7, 2.8, and 2.9). Whole exome analyses showed that the STIC lesions contained a total of 91, 23, 34 and 46 non-synonymous and synonymous somatic mutations, in CGOV65, CGOV64, CGOV303, and CGOV304 respectively. Overall, these analyses revealed that STICs in isolation in patients with or without germline *BRCA* changes have a roughly similar number of sequence changes to STICs in patients with sporadic tumors. These observations provide evidence that isolated STICs may act as precursors in the same manner as those identified in patients with sporadic advanced stages HGSOC analyzed in this study.

### **Recurrent molecular alterations**

We examined tumors from the nine patients to identify recurrent non-silent sequence or chromosomal changes. Although no genes other than *TP53* were mutated in all patients analyzed, we identified mutations in ten genes that were altered in two or more patients (Supplementary Table 2.6). These included mutations in the tumors of two patients of the *PIK3R5* gene that encodes a regulatory subunit of the PI3-kinase complex. CGOV64 also had a somatic alteration in *PTEN* that together with changes in *PIK3R5* highlight the importance of the PI3K pathway in ovarian cancer<sup>16</sup>. Additional genes that were observed to be altered in other ovarian cancers through other large scale sequencing efforts such as TCGA<sup>16</sup> are indicated in Supplementary Data 6.

In addition to recurrent sequence changes, we found alterations in regions of allelic imbalances encompassing several tumor suppressor genes involved in ovarian cancer. Remarkably, these included losses of *BRCA1*, *BRCA2* and *TP53* in all nine patients, and loss of *PTEN* for CGOV62, CGOV63, CGOV280 and CGOV64 (in addition to the somatic sequence alterations of these genes) (Supplementary Figures 2.1-2.9). In all cases, the LOH observed in the metastatic lesions and ovarian tumor lesions for regions encompassing these genes were already present in the fallopian tube tumor and STIC lesions. Considering the evolutionary model above, these data suggest that a combination of sequence changes in a few genes including *TP53* together with loss of the *TP53* wild-type allele as well as *BRCA1*, *BRCA2*, and *PTEN* may be crucial early events that are needed for the initiation of STICs<sup>56,57</sup>.

### **Evolutionary timeline of ovarian cancer development**

To estimate the time between the development of the earliest neoplastic clones in the fallopian tube and the development of ovarian and other metastatic lesions we used a mathematical model for comparative lesion analysis<sup>29,58</sup>. This model estimates the time interval between a founder cell of a tumor of interest and the ancestral precursor cell assuming that mutation rates and cell division times are constant throughout a patient's life. In the patient CGOV62, this model would suggest

~1.9 years between the development of the STIC lesion and the ovarian cancer (90% CI, 0.5 – 4.2 years). For other patients this transition appears to have been slower as the average time between STICs and ovarian cancer among all patients was 6.5 years (range 1.4 to 10.7 years). Importantly, in patients with metastatic lesions, the time between the initiation of the ovarian carcinoma and development of metastases appears to have been rapid (average 2.0 years). There were either no additional mutations in metastatic lesions (e.g. CGOV62 omental, rectal or appendiceal metastasis or CGOV280 omental metastasis) or the number of additional changes was small (e.g. three changes in CGOV278 omental metastasis), reflecting the ease with which cancer cells located on the ovaries can subsequently seed additional peritoneal sites. Although the precise timing of this progression depends on assumptions related to mutation rates, which may change during tumor progression, models employing different rates all showed longer timeline from STIC lesions to ovarian tumors followed by rapid development of metastatic lesions.

**Figure 2.1. Schematic of sample isolation and next-generation sequencing analyses.** (Top panel) Tumor sites analyzed from CGOV62 with stage III HGSOC. For each sample, slides were stained with hematoxylin and eosin as well as analyzed by immunohistochemical staining of p53. (Middle panel) Tumor samples were microdissected for genomic analyses. For microdissection for STIC and p53 signature lesions, tumor cells were identified using immunohistochemical staining of p53 and isolated through laser capture microdissection. (Bottom panel, left) Next-generation sequencing analyses were performed for tumor specimens using either whole-exome or targeted analyses focused on 120 genes. (Bottom panel, right) Somatic mutations and chromosomal alterations were used to evaluate tumor evolution using the tumor subclonality phylogenetic reconstruction algorithm SCHISM and to determine a timeline for tumor progression.

**Figure 2.2. Somatic mutation and allelic imbalance profiles among different tumor lesions.** Somatic mutations and segments of allelic imbalance detected by whole-exome analyses are indicated as colored cells in rows for all patients. Darker shades of each color indicate somatic mutations while lighter shades indicate allelic imbalances. The tumor samples analyzed for each patient are indicated in columns (p53 sig, p53 signature; STIC, serous tubal intraepithelial carcinoma). For ovarian tumors in CGOV62 and STIC lesions in CGOV63 multiple blocks are indicated, including one ovarian tumor where multiple sections were analyzed after hematoxylin and eosin staining or after immunohistochemistry (IHC) staining of p53. These analyses indicated that staining methods did not affect detection of somatic alterations. The color of mutations indicates the degree of relatedness among tumor samples: red, shared among all tumor samples with TP53 highlighted at the top row; green, shared among all tumor samples except p53 signature lesion; purple, shared among fallopian tube tumor and omental metastasis; blue indicates mutations that were first detected in the ovarian tumors; and gray indicates mutations that were only detected in metastatic lesions. Additional color shades or patterns indicate mutations that are localized to specific lesions or lost due to chromosome loss as shown in the legend.

**Figure 2.3. Genome-wide allelic imbalance profile.** Minor allele frequency of heterozygous SNPs identified from normal tissue in each patient are derived in each tumor sample, enabling assessment of allelic imbalance in ~17,000 loci across the exome. Circular binary segmentation (CBS) is applied to minor allele frequencies of SNPs with minimum coverage of 10x in each tumor sample, and the resulting segment means are shown as a heatmap. Asterisks indicate samples where corresponding mutation analyses were not performed due to low tumor purity (omental metastasis of CGOV279, right ovarian tumor of CGOV278) or miliary pattern of tumor samples (peritoneal metastases of CGOV63). Given the relatively lower number of distinct DNA molecules available from the p53 signature samples from CGOV62 and CGOV63, these samples are subject to a more sensitive LOH analysis (Methods, Genome-wide imbalance analysis) and are not shown here.

**Figure 2.4. Schematic of tumor evolution.** The history of tumor evolution in each patient is modeled as a subclonal hierarchy inferred from the somatic mutations and large scale genomic regions harboring loss of heterozygosity (LOH features) using the SCHISM framework, and is depicted as tree. Each tree starts from a root node corresponding the normal fallopian tube epithelium (germline). In all patients, mutations in *TP53* (red boxes) are among the earliest somatic alterations and are ubiquitously present in all tumor samples. Somatic alterations (boxes) are acquired along edges (arrows) of the tree, and example alterations are indicated in each case. Nodes of the tree represent cells whose genotype is described by the presence of somatic mutations and LOH features on the path connecting the node to the root of the tree. Each node is labeled with tumor samples harboring all upstream and lacking any downstream alterations. The trees inferred for all patients support a pattern of evolution with p53 signatures and STIC lesions as early events in tumorigenesis. Mutation clusters and LOH feature groups follow the same color code as Figure 2.

**Supplementary Figure 2.1. Loss of heterozygosity analyses for CGOV62.** The graphs represent B allele frequencies (BAFs) for the indicated chromosomes. A value of 0.5 indicates a heterozygous genotype (AB) whereas allelic imbalances in tumor samples are observed as a deviation from 0.5. BAF values of 0 typically indicate loss of heterozygosity, although normal contaminating tissue may limit the minimum observed value. Graphs for CGOV62 include left fallopian tube STIC, left fallopian tube tumor, left ovarian tumor block A4, left ovarian tumor block A7, right ovarian tumor, rectal metastasis, appendiceal metastasis, and omental metastasis. LOH events that contain *PTEN*, *BRCA2*, *TP53* and *BRCA1* genes are indicated by the red boxes.

**Supplementary Figure 2.2. Loss of heterozygosity analyses for CGOV63.** The graphs represent B allele frequencies (BAFs) for the indicated chromosomes. A value of 0.5 indicates a heterozygous genotype (AB) whereas allelic imbalances in tumor samples are observed as a deviation from 0.5. BAF values of 0 typically indicate loss of heterozygosity, although normal contaminating tissue may limit the minimum observed value. Graphs for CGOV63 include STIC block D1, STIC block D2, STIC block D3, right fallopian tumor, right ovarian tumor, sigmoid metastasis, rectal metastasis. LOH events that contain *PTEN*, *BRCA2*, *TP53* and *BRCA1* genes are indicated by the red boxes.

**Supplementary Figure 2.3. Loss of heterozygosity analyses for CGOV280.** The graphs represent B allele frequencies (BAFs) for the indicated chromosomes. A value of 0.5 indicates a heterozygous genotype (AB) whereas allelic imbalances in tumor samples are observed as a deviation from 0.5. BAF values of 0 typically indicate loss of heterozygosity, although normal contaminating tissue may limit the minimum observed value. Graphs for CGOV280 include STIC of the right fallopian tube, right fallopian tube tumor, right ovarian tumor, omental metastasis, stic of the left fallopian tube. LOH events that contain *PTEN*, *BRCA2*, *TP53* and *BRCA1* genes are indicated by the red boxes.

**Supplementary Figure 2.4. Loss of heterozygosity analyses for CGOV279.** The graphs represent B allele frequencies (BAFs) for the indicated chromosomes. A value of 0.5 indicates a heterozygous genotype (AB) whereas allelic imbalances in tumor samples are observed as a deviation from 0.5. BAF values of 0 typically indicate loss of heterozygosity, although normal contaminating tissue may limit the minimum observed value. Graphs for CGOV279 include STIC of the right fallopian tube, STIC of the right fallopian tube close to the tumor, right fallopian tube tumor, right ovarian tumor. LOH events that contain *BRCA2*, *TP53* and *BRCA1* genes are indicated by the red boxes, while the LOH region in chromosome 10 of this sample does not overlap with the *PTEN* gene.

**Supplementary Figure 2.5. Loss of heterozygosity analyses for CGOV278.** The graphs represent B allele frequencies (BAFs) for the indicated chromosomes. A value of 0.5 indicates a heterozygous genotype (AB) whereas allelic imbalances in tumor samples are observed as a deviation from 0.5. BAF values of 0 typically indicate loss of heterozygosity, although normal contaminating tissue may limit the minimum observed value. Graphs for CGOV278 include STIC of left fallopian tumor, left ovarian tumor, omental metastasis. LOH events that contain *BRCA2*, *TP53* and *BRCA1* genes are indicated by the red boxes, while the LOH region in chromosome 10 of this sample does not overlap with the *PTEN* gene.

**Supplementary Figure 2.6. Loss of heterozygosity analyses for CGOV65.** The graphs represent B allele frequencies (BAFs) for the indicated chromosomes for the STIC lesion. A value of 0.5 indicates a heterozygous genotype (AB) whereas allelic imbalances in tumor samples are observed as a deviation from 0.5. BAF values of 0 typically indicate loss of heterozygosity, although normal contaminating tissue may limit the minimum observed value. LOH events that contain *PTEN*, *BRCA2*, *TP53* and *BRCA1* genes are indicated by the red boxes.

**Supplementary Figure 2.7. Loss of heterozygosity analyses for CGOV64.** The graphs represent B allele frequencies (BAFs) for the indicated chromosomes for the STIC lesion. A value of 0.5 indicates a heterozygous genotype (AB) whereas allelic imbalances in tumor samples are observed as a deviation from 0.5. BAF values of 0 typically indicate loss of heterozygosity, although normal contaminating tissue may limit the minimum observed value. LOH events that contain *BRCA2*, *TP53* and *BRCA1* genes are indicated by the red boxes, while the LOH region in chromosome 10 of this sample does not overlap with the *PTEN* gene.

**Supplementary Figure 2.8. Loss of heterozygosity analyses for CGOV303.** The graphs represent B allele frequencies (BAFs) for the indicated chromosomes for the STIC lesion. A value of 0.5 indicates a heterozygous genotype (AB) whereas allelic imbalances in tumor samples are observed as a deviation from 0.5. BAF values of 0 typically indicate loss of heterozygosity, although normal contaminating tissue may limit the minimum observed value. LOH events that contain *BRCA2*, *TP53* and *BRCA1* genes are indicated by the red boxes, while no LOH in chromosome 10 containing *PTEN* was observed.

**Supplementary Figure 2.9. Loss of heterozygosity analyses for CGOV304.** The graphs represent B allele frequencies (BAFs) for the indicated chromosomes for the STIC lesion. A value of 0.5 indicates a heterozygous genotype (AB) whereas allelic imbalances in tumor samples are observed as a deviation from 0.5. BAF values of 0 typically indicate loss of heterozygosity, although normal contaminating tissue may limit the minimum observed value. LOH events that contain *BRCA2*, *TP53* and *BRCA1* genes are indicated by the red boxes, while no LOH in chromosome 10 containing *PTEN* was observed.

**Supplementary Figure 2.10. Genome-wide copy number profile.** Copy number ratio of genomic bins were determined based on target and off-target reads from whole exome sequencing. The raw copy ratio were corrected for GC-content, repetitive sequences, and target capture enrichment using CNVkit, and then converted to integer copy levels by accounting for tumor purity and average genome-wide ploidy (Methods, copy number analysis). The resulting copy number profiles suggest a relatively consistent pattern of copy number aberrations across the lesions analyzed from each patient.

**Supplementary Figure 2.11. Schematic of tumor evolution using PHYLIP.** Visualization of evolutionary trees from each patient based on mutational and LOH changes. Branch lengths are proportional to the number of somatic alterations.

**Supplementary Table 2.1. Summary of Patient and Sample Characteristics**

<b>Patient ID</b>	<b>Age</b>	<b>Diagnosis</b>	<b>Sample ID</b>	<b>Histopathologic Diagnosis</b>

### Supplementary Data 2.3. Targeted Sequencing Panel

Gene Symbol	Gene Description
ABL1	c-abl oncogene 1, non-receptor tyrosine kinase
AKT1	v-akt murine thymoma viral oncogene homolog 1
AKT2	v-akt murine thymoma viral oncogene homolog 2
ALK	anaplastic lymphoma receptor tyrosine kinase
APC	adenomatous polyposis coli
AR	androgen receptor
ARID1A	AT rich interactive domain 1A (SWI-like)
ARID1B	AT rich interactive domain 1B (SWI1-like)
ASXL1	additional sex combs like 1
ATM	ataxia telangiectasia mutated
ATRX	alpha thalassemia/mental retardation syndrome X-linked
BAP1	BRCA1 associated protein-1
BCR	breakpoint cluster region
BRAF	v-raf murine sarcoma viral oncogene homolog B1
BRCA1	breast cancer 1, early onset
BRCA2	breast cancer 2, early onset
CBL	Cas-Br-M (murine) ecotropic retroviral transforming sequence
CCND1	cyclin D1
CCNE1	cyclin E1
CDH1	cadherin 1, type 1, E-cadherin (epithelial)
CDK4	cyclin-dependent kinase 4
CDK6	cyclin-dependent kinase 6
CDKN2A	cyclin-dependent kinase inhibitor 2A
CEBPA	CCAAT/enhancer binding protein (C/EBP), alpha
CREBBP	CREB binding protein
CTNNB1	catenin (cadherin-associated protein), beta 1, 88kDa
DAXX	death-domain associated protein
DNMT3A	DNA (cytosine-5-)-methyltransferase 3 alpha
EGFR	epidermal growth factor receptor
ERBB2	v-erb-b2 erythroblastic leukemia viral oncogene homolog 2
ERBB3	v-erb-b2 erythroblastic leukemia viral oncogene homolog 3
ERBB4	v-erb-a erythroblastic leukemia viral oncogene homolog 4
ETV1	ets variant 1
ETV4	ets variant 4
ETV5	ets variant 5
ETV6	ets variant 6
EWSR1	Ewing sarcoma breakpoint region 1
EZH2	Enhancer of zeste homolog 2
FBXW7	F-box and WD repeat domain containing 7

FGFR2	fibroblast growth factor receptor 2
FGFR3	fibroblast growth factor receptor 3
FGFR4	fibroblast growth factor receptor 4
FLT3	fms-related tyrosine kinase 3
FOXL2	forkhead box L2
GATA1	GATA binding protein 1 (globin transcription factor 1)
GATA2	GATA binding protein 2
GNA11	guanine nucleotide binding protein (G protein), alpha 11
GNAQ	guanine nucleotide binding protein (G protein), q polypeptide
GNAS	GNAS complex locus
HNF1A	HNF1 homeobox A
HRAS	v-Ha-ras Harvey rat sarcoma viral oncogene homolog
IDH1	isocitrate dehydrogenase 1 (NADP+), soluble
IDH2	isocitrate dehydrogenase 2 (NADP+), mitochondrial
IGF1R	insulin-like growth factor 1 receptor
IGF2R	insulin-like growth factor 2 receptor
IKZF1	IKAROS family zinc finger 1 (Ikaros)
JAK1	Janus kinase 1
JAK2	Janus kinase 2
JAK3	Janus kinase 3
KDR	kinase insert domain receptor (a type III receptor tyrosine kinase)
KIT	v-kit Hardy-Zuckerman 4 feline sarcoma viral oncogene homolog
KRAS	v-Ki-ras2 Kirsten rat sarcoma viral oncogene homolog
MAML1	mastermid-like 1
MDM2	Mdm2, p53 E3 ubiquitin protein ligase homolog
MDM4	Mdm4 p53 binding protein homolog
MED12	mediator complex subunit 12
MEN1	multiple endocrine neoplasia I
MET	met proto-oncogene (hepatocyte growth factor receptor)
MLH1	mutL homolog 1, colon cancer, nonpolyposis type 2
MLL	myeloid/lymphoid or mixed-lineage leukemia
MPL	myeloproliferative leukemia virus oncogene
MSH2	mutS homolog 2, colon cancer, nonpolyposis type 1
MSH6	mutS homolog 6
MYC	v-myc myelocytomatosis viral oncogene homolog
MYCN	v-myc myelocytomatosis viral related oncogene, neuroblastoma derived
MYD88	myeloid differentiation primary response gene
NF1	neurofibromin 1
NF2	neurofibromin 2 (merlin)
NOTCH1	notch 1
NOTCH2	notch 2
NOTCH3	notch 3
NOTCH4	notch 4

NPM1	nucleophosmin (nucleolar phosphoprotein B23, numatrin)
NRAS	neuroblastoma RAS viral (v-ras) oncogene homolog
PALB2	partner and localizer of BRCA2
PAX5	paired box 5
PBRM1	polybromo 1
PDGFRA	platelet-derived growth factor receptor, alpha polypeptide
PDGFRB	platelet-derived growth factor receptor, beta polypeptide
PIK3CA	phosphoinositide-3-kinase, catalytic, alpha polypeptide
PIK3R1	phosphoinositide-3-kinase, regulatory subunit 1 (alpha)
PMS2	PMS2 postmeiotic segregation increased 2
PTCH1	patched 1
PTEN	phosphatase and tensin homolog
PTPN11	protein tyrosine phosphatase, non-receptor type 11
RAF1	v-raf-1 murine leukemia viral oncogene homolog 1
RAR-alpha (PML)	retinoic acid receptor, alpha
RB1	retinoblastoma 1
RET	ret proto-oncogene
RNF43	ring finger protein 43
ROS1	c-ros oncogene 1 , receptor tyrosine kinase
RUNX1	runt-related transcription factor 1
SF3B1	splicing factor 3b, subunit 1
SMAD2	SMAD family member 2
SMAD3	SMAD family member 3
SMAD4	SMAD family member 4
SMARCB1	SWI/SNF related, actin dependent regulator of chromatin, subfamily b, member 1
SMO	smoothened, frizzled family receptor
STAG2	stromal antigen 2
STK11	serine/threonine kinase 11
TET2	tet methylcytosine dioxygenase 2
TGFBR2	transforming growth factor, beta receptor II (70/80kDa)
TMPRSS2	transmembrane protease, serine 2
TNFAIP3	tumor necrosis factor, alpha-induced protein 3
TP53	Tumor protein p53
TSC1	tuberous sclerosis 1
TSC2	tuberous sclerosis 2
TSHR	thyroid stimulating hormone receptor
VHL	von Hippel-Lindau tumor suppressor
WT1	Wilms tumor 1

---

#### Supplementary Data 2.4. Somatic Sequence Alterations

Case ID	Analysis Type	Gene	Gene description	Transcript Accession
CGOV65T_0	Exome	ABI3BP	target of Nesh-SH3 precursor	NM_01
CGOV65T_0	Exome	ADAMTS9	ADAM metalloproteinase with thrombospondin type 1 motif; 9	CCDS2
CGOV65T_0	Exome	ADAMTSL3	ADAMTS-like 3	CCDS1
CGOV65T_0	Exome	ANKRD5	ankyrin repeat domain 5	CCDS1
CGOV65T_0	Exome	ATP10D	ATPase; class V; type 10D	CCDS3
CGOV65T_0	Exome	BCAS3	breast carcinoma amplified sequence 3	CCDS1
CGOV65T_0	Exome	BCR	breakpoint cluster region	CCDS1
CGOV65T_0	Exome	C1orf116	chromosome 1 open reading frame 116	CCDS1
CGOV65T_0	Exome	C20orf194	chromosome 20 open reading frame 194	CCDS4
CGOV65T_0	Exome	C3orf77	hypothetical protein LOC375337	NM_00
CGOV65T_0	Exome	CAMSAP1L1	calmodulin regulated spectrin-associated protein 1-like 1	CCDS1
CGOV65T_0	Exome	CCDC69	coiled-coil domain containing 69	CCDS4
CGOV65T_0	Exome	COL4A2	collagen; type IV; alpha 2	CCDS4
CGOV65T_0	Exome	CPA3	carboxypeptidase A3 (mast cell)	CCDS3
CGOV65T_0	Exome	CWC22	CWC22 spliceosome-associated protein homolog (S. cerevisiae)	NM_02
CGOV65T_0	Exome	DMBT1	deleted in malignant brain tumors 1 protein isoform b precursor	NM_00
CGOV65T_0	Exome	DOCK6	dedicator of cytokinesis protein 6	NM_02
CGOV65T_0	Exome	DOCK6	dedicator of cytokinesis protein 6	NM_02
CGOV65T_0	Exome	DUSP27	dual specificity phosphatase 27 (putative)	CCDS3

CGOV65T_0	Exome	EML6	echinoderm microtubule-associated protein-like 6	NM_00
CGOV65T_0	Exome	EXOC7	exocyst complex component 7	CCDS3
CGOV65T_0	Exome	FANCM	Fanconi anemia; complementation group M	CCDS3
CGOV65T_0	Exome	FANCM	Fanconi anemia; complementation group M	CCDS3
CGOV65T_0	Exome	FAT3	protocadherin Fat 3	NM_00
CGOV65T_0	Exome	FBF1	fas-binding factor 1	NM_00
CGOV65T_0	Exome	FBXO38	F-box protein 38	CCDS4
CGOV65T_0	Exome	FLRT2	fibronectin leucine rich transmembrane protein 2	CCDS9
CGOV65T_0	Exome	FOXS1	forkhead box S1	CCDS1
CGOV65T_0	Exome	GPR112	G protein-coupled receptor 112	CCDS3
CGOV65T_0	Exome	GRAMD2	GRAM domain containing 2	CCDS3
CGOV65T_0	Exome	GSR	glutathione reductase	CCDS3
CGOV65T_0	Exome	HEATR7B2	HEAT repeat-containing protein 7B2	NM_17
CGOV65T_0	Exome	HFM1	HFM1; ATP-dependent DNA helicase homolog (S. cerevisiae)	CCDS3
CGOV65T_0	Exome	IL11RA	interleukin 11 receptor; alpha	CCDS6
CGOV65T_0	Exome	INPP5E	inositol polyphosphate-5-phosphatase; 72 kDa	CCDS7
CGOV65T_0	Exome	ITGA5	integrin; alpha 5 (fibronectin receptor; alpha polypeptide)	CCDS8
CGOV65T_0	Exome	KIAA0913	zinc finger SWIM domain-containing protein KIAA0913 isoform 1	NM_01
CGOV65T_0	Exome	KIAA1199	KIAA1199	CCDS1
CGOV65T_0	Exome	KIF9	kinesin family member 9	CCDS2
CGOV65T_0	Exome	KLB	klotho beta	CCDS3
CGOV65T_0	Exome	LRP1B	low density lipoprotein receptor-related protein 1B	CCDS2
CGOV65T_0	Exome	MAP7D2	MAP7 domain containing 2	CCDS1

CGOV65T_0	Exome	MID1IP1	MID1 interacting protein 1 (gastrulation specific G12 homolog (zebrafish))	CCDS1
CGOV65T_0	Exome	MUC16	mucin-16	NM_02
CGOV65T_0	Exome	MUC4	mucin 4; cell surface associated	CCDS3
CGOV65T_0	Exome	MYO1F	myosin IF	CCDS4
CGOV65T_0	Exome	MYO7B	myosin-VIIb	NM_00
CGOV65T_0	Exome	NHS	Nance-Horan syndrome (congenital cataracts and dental anomalies)	CCDS1
CGOV65T_0	Exome	NPR2	natriuretic peptide receptor B/guanylate cyclase B (atrionatriuretic peptide receptor B)	CCDS6
CGOV65T_0	Exome	OR14I1	olfactory receptor; family 14; subfamily I; member 1	CCDS3
CGOV65T_0	Exome	OR4K13	olfactory receptor; family 4; subfamily K; member 13	CCDS3
CGOV65T_0	Exome	OR5P3	olfactory receptor; family 5; subfamily P; member 3	CCDS7
CGOV65T_0	Exome	PAN2	PAN2 poly(A) specific ribonuclease subunit homolog (S. cerevisiae)	CCDS8
CGOV65T_0	Exome	PCNX	pecanex homolog (Drosophila)	CCDS9
CGOV65T_0	Exome	PDGFRB	platelet-derived growth factor receptor; beta polypeptide	CCDS4
CGOV65T_0	Exome	PIK3R5	phosphoinositide-3-kinase; regulatory subunit 5	CCDS1
CGOV65T_0	Exome	PPP1R13L	protein phosphatase 1; regulatory (inhibitor) subunit 13 like	CCDS3
CGOV65T_0	Exome	PRDM10	PR domain containing 10	CCDS8
CGOV65T_0	Exome	PRDM16	PR domain containing 16	CCDS4
CGOV65T_0	Exome	PRKG1	protein kinase; cGMP- dependent; type I	CCDS7
CGOV65T_0	Exome	PTCHD2	patched domain containing 2	CCDS4
CGOV65T_0	Exome	PTPN13	tyrosine-protein phosphatase non-receptor type 13 isoform 4	NM_08
CGOV65T_0	Exome	PTPRH	protein tyrosine phosphatase; receptor type; H	CCDS3

CGOV65T_0	Exome	RAPGEF2	Rap guanine nucleotide exchange factor (GEF) 2	CCDS4
		RASSF5	Ras association (RalGDS/AF-6) domain family member 5	CCDS3
CGOV65T_0	Exome	RUNDC1	RUN domain containing 1	CCDS1
CGOV65T_0	Exome	RYR1	ryanodine receptor 1 (skeletal)	CCDS3
CGOV65T_0	Exome	SCML4	sex comb on midleg-like 4 (Drosophila)	NM_19
CGOV65T_0	Exome	SCUBE2	signal peptide; CUB domain; EGF-like 2	CCDS7
		SLC16A13	solute carrier family 16; member 13	CCDS1
CGOV65T_0	Exome		(monocarboxylic acid transporter 13)	
		SLC9A3	solute carrier family 9 (sodium/hydrogen exchanger); member 3	CCDS3
CGOV65T_0	Exome		spastic paraplegia 7 (pure and complicated autosomal recessive)	CCDS1
CGOV65T_0	Exome	SPG7		CCDS1
CGOV65T_0	Exome	SRPX	sushi-repeat-containing protein; X-linked	CCDS1
CGOV65T_0	Exome	SYNE2	spectrin repeat containing; nuclear envelope 2	CCDS9
CGOV65T_0	Exome	THBS1	thrombospondin 1	CCDS3
CGOV65T_0	Exome	TLX2	T-cell leukemia homeobox 2	CCDS1
CGOV65T_0	Exome	TP53	tumor protein p53	CCDS1
		TRPC5	transient receptor potential cation channel; subfamily C; member 5	CCDS1
CGOV65T_0	Exome		transient receptor potential cation channel; subfamily M; member 1	CCDS1
CGOV65T_0	Exome	TRPM1		CCDS1
CGOV65T_0	Exome	TTLL13	tubulin tyrosine ligase-like family; member 13	CCDS3
CGOV65T_0	Exome	TTN	titin	ENST038
CGOV65T_0	Exome	UGGT1	UDP-glucose glycoprotein glucosyltransferase 1	CCDS2
CGOV65T_0	Exome	WDFY4	WD repeat- and FYVE domain-containing protein 4	NM_02
CGOV65T_0	Exome	WDR11	WD repeat domain 11	CCDS7
CGOV65T_0	Exome	ZC3H12B	probable ribonuclease ZC3H12B	NM_00

CGOV65T_0	Exome	ZC3H12C	zinc finger CCCH-type containing 12C	NM_03
CGOV65T_0	Exome	ZCCHC6	zinc finger; CCHC domain containing 6	CCDS3
CGOV65T_0	Exome	ZNF446	zinc finger protein 446	CCDS1
CGOV65T_0	Exome	ZNF622	zinc finger protein 622	CCDS3
CGOV65T_0	Exome	ZNF764	zinc finger protein 764	CCDS1
CGOV65T_0	Exome	ZBP2	zona pellucida binding protein 2	CCDS1
CGOV64T	Exome	ABCA13	ATP-binding cassette; sub-family A (ABC1); member 13	ENST079
CGOV64T	Exome	DOCK11	dedicator of cytokinesis 11	CCDS3
CGOV64T	Exome	DPP10	dipeptidyl-peptidase 10 (non-functional)	NM_02
CGOV64T	Exome	IGDCC3	immunoglobulin superfamily; DCC subclass; member 3	CCDS1
CGOV64T	Exome	KIF13A	kinesin-like protein KIF13A isoform a	NM_02
CGOV64T	Exome	KLHL6	kelch-like 6 (Drosophila)	CCDS3
CGOV64T	Exome	LIMK2	LIM domain kinase 2	CCDS3
CGOV64T	Exome	MED14	mediator complex subunit 14	CCDS1
CGOV64T	Exome	MYCBP2	MYC binding protein 2	CCDS3
CGOV64T	Exome	NUP35	nucleoporin 35kDa	CCDS2
CGOV64T	Exome	PAK6	p21 protein (Cdc42/Rac)-activated kinase 6	CCDS1
CGOV64T	Exome	PIK3R5	phosphoinositide-3-kinase; regulatory subunit 5	CCDS1
CGOV64T	Exome	PLS3	plastin 3	CCDS1
CGOV64T	Exome	PTEN	phosphatase and tensin homolog	CCDS3
CGOV64T	Exome	PTH2R	parathyroid hormone 2 receptor	CCDS2
CGOV64T	Exome	RGL2	Ral guanine nucleotide dissociation stimulator-like 2 (RalGDS-like factor) (RAS-associated protein RAB2L).	CCDS4
CGOV64T	Exome	RTKN	rhotekin	CCDS3

CGOV64T	Exome	SLC14A2	solute carrier family 14 (urea transporter); member 2	CCDS1
		TAB3	TGF-beta activated kinase 1/MAP3K7 binding protein 3	CCDS1
CGOV64T	Exome	TLN1	talin 1	CCDS3
CGOV64T	Exome	TP53	tumor protein p53	CCDS1
CGOV64T	Exome	WDFY4	WD repeat- and FYVE domain-containing protein 4	NM_02
CGOV64T	Exome	XPO7	exportin 7	NM_00
CGOV63T_9 _1	Exome	AADACL2	arylacetamide deacetylase- like 2	CCDS3
CGOV63T_9 _1	Exome	ABI2	abl-interactor 2	CCDS2
CGOV63T_9 _1	Exome	ACVR1C	activin A receptor; type IC	CCDS2
CGOV63T_9 _1	Exome	ATP2B3	ATPase; Ca++ transporting; plasma membrane 3	CCDS3
CGOV63T_9 _1	Exome	C12orf43	chromosome 12 open reading frame 43	CCDS9
CGOV63T_9 _1	Exome	C1orf174	chromosome 1 open reading frame 174	CCDS5
CGOV63T_9 _1	Exome	C2orf21	Uncharacterized protein C2orf21.	CCDS2
CGOV63T_9 _1	Exome	C7orf62	chromosome 7 open reading frame 62	CCDS3
CGOV63T_9 _1	Exome	C9orf152	chromosome 9 open reading frame 152	CCDS3
CGOV63T_9 _1	Exome	CA6	carbonic anhydrase VI	ENST0 74
CGOV63T_9 _1	Exome	CAPRIN2	caprin family member 2	CCDS3
CGOV63T_9 _1	Exome	CAPZA3	capping protein (actin filament) muscle Z-line; alpha 3	CCDS8
CGOV63T_9 _1	Exome	CARD8	caspase recruitment domain family; member 8	ENST0 61
CGOV63T_9 _1	Exome	CDH5	cadherin 5; type 2 (vascular endothelium)	CCDS1
CGOV63T_9 _1	Exome	CEP135	centrosomal protein 135kDa	CCDS3
CGOV63T_9 _1	Exome	CLCC1	chloride channel CLIC-like 1	CCDS4
CGOV63T_9 _1	Exome	CLSPN	claspin homolog (Xenopus laevis)	CCDS3
CGOV63T_9 _1	Exome	CSMD1	CUB and sushi domain- containing protein 1 precursor	NM_03

CGOV63T_9 _1	Exome	CSMD1	CUB and sushi domain- containing protein 1 precursor	NM_03
CGOV63T_9 _1	Exome	CWC22	CWC22 spliceosome- associated protein homolog ( <i>S. cerevisiae</i> )	NM_02
CGOV63T_9 _1	Exome	DGKB	diacylglycerol kinase; beta 90kDa	NM_00
CGOV63T_9 _1	Exome	DLEC1	deleted in lung and esophageal cancer 1	CCDS2
CGOV63T_9 _1	Exome	DNAH3	dynein; axonemal; heavy chain 3	CCDS1
CGOV63T_9 _1	Exome	ERBB3	v-erb-b2 erythroblastic leukemia viral oncogene homolog 3 (avian)	CCDS3
CGOV63T_9 _1	Exome	FAM135B	family with sequence similarity 135; member B	CCDS6
CGOV63T_9 _1	Exome	FAM135B	family with sequence similarity 135; member B	CCDS6
CGOV63T_9 _1	Exome	GJB1	gap junction protein; beta 1; 32kDa	CCDS1
CGOV63T_9 _1	Exome	HCK	hemopoietic cell kinase	ENST0 52
CGOV63T_9 _1	Exome	HTR1E	5-hydroxytryptamine (serotonin) receptor 1E	CCDS5
CGOV63T_9 _1	Exome	INTS9	integrator complex subunit 9	CCDS3
CGOV63T_9 _1	Exome	KIAA1217	KIAA1217	CCDS3
CGOV63T_9 _1	Exome	KIF13A	kinesin-like protein KIF13A isoform a	NM_02
CGOV63T_9 _1	Exome	LINGO4	leucine rich repeat and Ig domain containing 4	CCDS3
CGOV63T_9 _1	Exome	LRRC15	leucine rich repeat containing 15	CCDS3
CGOV63T_9 _1	Exome	MACF1	microtubule-actin crosslinking factor 1	CCDS4
CGOV63T_9 _1	Exome	MUC7	mucin 7; secreted	CCDS3
CGOV63T_9 _1	Exome	NFS1	Cysteine desulfurase, mitochondrial precursor	CCDS1
CGOV63T_9 _1	Exome	NID1	nidogen 1	CCDS1
CGOV63T_9 _1	Exome	NPHS2	nephrosis 2; idiopathic; steroid-resistant (podocin)	CCDS1
CGOV63T_9 _1	Exome	NRK	nik-related protein kinase	NM_19
CGOV63T_9 _1	Exome	OR4F15	olfactory receptor; family 4; subfamily F; member 15	CCDS3
CGOV63T_9 _1	Exome	PHOX2B	paired-like homeobox 2b	CCDS3

CGOV63T_9 _1	Exome	PTPRJ	protein tyrosine phosphatase; receptor type; J	CCDS7
CGOV63T_9 _1	Exome	RDH10	retinol dehydrogenase 10 (all-trans)	CCDS6
CGOV63T_9 _1	Exome	RPS6KA5	ribosomal protein S6 kinase; 90kDa; polypeptide 5	CCDS9
CGOV63T_9 _1	Exome	SEPT6	septin 6	CCDS1
CGOV63T_9 _1	Exome	SFMBT2	Scm-like with four mbt domains 2	CCDS3
CGOV63T_9 _1	Exome	SHH	sonic hedgehog homolog (Drosophila)	CCDS5
CGOV63T_9 _1	Exome	SILV	silver homolog (mouse)	CCDS8
CGOV63T_9 _1	Exome	SLC17A6	solute carrier family 17 (sodium-dependent inorganic phosphate cotransporter); member 6	CCDS7
CGOV63T_9 _1	Exome	SLC44A3	solute carrier family 44; member 3	CCDS7
CGOV63T_9 _1	Exome	SORCS3	sortilin-related VPS10 domain containing receptor 3	CCDS7
CGOV63T_9 _1	Exome	STX11	syntaxin 11	CCDS5
CGOV63T_9 _1	Exome	TARBP1	TAR (HIV-1) RNA binding protein 1	CCDS1
CGOV63T_9 _1	Exome	TMEM62	transmembrane protein 62	CCDS3
CGOV63T_9 _1	Exome	TP53	tumor protein p53	CCDS1
CGOV63T_9 _1	Exome	TRIM35	tripartite motif-containing 35	CCDS6
CGOV63T_9 _1	Exome	TRIP12	thyroid hormone receptor interactor 12	CCDS3
CGOV63T_9 _1	Exome	TTN	titin	ENST0 38
CGOV63T_9 _1	Exome	TWISTNB	TWIST neighbor	CCDS3
CGOV63T_9 _1	Exome	UNC13A	protein unc-13 homolog A	NM_00
CGOV63T_9 _1	Exome	UROCI	urocanase domain containing 1	CCDS3
CGOV63T_9 _1	Exome	ZNF345	zinc finger protein 345	CCDS1
CGOV63T_9 _1	Exome	ZNF462	zinc finger protein 462	CCDS3
CGOV63T_7 _1	Exome	ACVR1C	activin A receptor; type IC	CCDS2

CGOV63T_7 _1	Exome	ATP2B3	ATPase; Ca++ transporting; plasma membrane 3	CCDS3
CGOV63T_7 _1	Exome	C12orf43	chromosome 12 open reading frame 43	CCDS9
CGOV63T_7 _1	Exome	C16orf68	chromosome 16 open reading frame 68	CCDS1
CGOV63T_7 _1	Exome	C1orf174	chromosome 1 open reading frame 174	CCDS5
CGOV63T_7 _1	Exome	C2orf21	Uncharacterized protein C2orf21.	CCDS2
CGOV63T_7 _1	Exome	C9orf152	chromosome 9 open reading frame 152	CCDS3
CGOV63T_7 _1	Exome	CA6	carbonic anhydrase VI	ENST0 74
CGOV63T_7 _1	Exome	CAPRIN2	caprin family member 2	CCDS3
CGOV63T_7 _1	Exome	CAPZA3	capping protein (actin filament) muscle Z-line; alpha 3	CCDS8
CGOV63T_7 _1	Exome	CARD8	caspase recruitment domain family; member 8	ENST0 61
CGOV63T_7 _1	Exome	CDH5	cadherin 5; type 2 (vascular endothelium)	CCDS1
CGOV63T_7 _1	Exome	CEP135	centrosomal protein 135kDa	CCDS3
CGOV63T_7 _1	Exome	CLSPN	claspin homolog (Xenopus laevis)	CCDS3
CGOV63T_7 _1	Exome	CSMD1	CUB and sushi domain- containing protein 1 precursor	NM_03
CGOV63T_7 _1	Exome	CWC22	CWC22 spliceosome- associated protein homolog (S. cerevisiae)	NM_02
CGOV63T_7 _1	Exome	DGKB	diacylglycerol kinase; beta 90kDa	NM_00
CGOV63T_7 _1	Exome	DLEC1	deleted in lung and esophageal cancer 1	CCDS2
CGOV63T_7 _1	Exome	DNAH3	dynein; axonemal; heavy chain 3	CCDS1
CGOV63T_7 _1	Exome	ERBB3	v-erb-b2 erythroblastic leukemia viral oncogene homolog 3 (avian)	CCDS3
CGOV63T_7 _1	Exome	FAM135B	family with sequence similarity 135; member B	CCDS6
CGOV63T_7 _1	Exome	FAM135B	family with sequence similarity 135; member B	CCDS6
CGOV63T_7 _1	Exome	GJB1	gap junction protein; beta 1; 32kDa	CCDS1
CGOV63T_7 _1	Exome	HCK	hemopoietic cell kinase	ENST0 52

CGOV63T_7 _1	Exome	INTS9	integrator complex subunit 9	CCDS3
CGOV63T_7 _1	Exome	KIF13A	kinesin-like protein KIF13A isoform a	NM_02
CGOV63T_7 _1	Exome	LINGO4	leucine rich repeat and Ig domain containing 4	CCDS3
CGOV63T_7 _1	Exome	LRRC15	leucine rich repeat containing 15	CCDS3
CGOV63T_7 _1	Exome	MACF1	microtubule-actin crosslinking factor 1	CCDS4
CGOV63T_7 _1	Exome	NFS1	Cysteine desulfurase, mitochondrial precursor	CCDS1
CGOV63T_7 _1	Exome	NID1	nidogen 1	CCDS1
CGOV63T_7 _1	Exome	OR4F15	olfactory receptor; family 4; subfamily F; member 15	CCDS3
CGOV63T_7 _1	Exome	PHOX2B	paired-like homeobox 2b	CCDS3
CGOV63T_7 _1	Exome	PTPRJ	protein tyrosine phosphatase; receptor type; J	CCDS7
CGOV63T_7 _1	Exome	RDH10	retinol dehydrogenase 10 (all-trans)	CCDS6
CGOV63T_7 _1	Exome	RPS6KA5	ribosomal protein S6 kinase; 90kDa; polypeptide 5	CCDS9
CGOV63T_7 _1	Exome	SEPT6	septin 6	CCDS1
CGOV63T_7 _1	Exome	SFMBT2	Scm-like with four mbt domains 2	CCDS3
CGOV63T_7 _1	Exome	SHH	sonic hedgehog homolog (Drosophila)	CCDS5
CGOV63T_7 _1	Exome	SILV	silver homolog (mouse)	CCDS8
CGOV63T_7 _1	Exome	SLC17A6	solute carrier family 17 (sodium-dependent inorganic phosphate cotransporter); member 6	CCDS7
CGOV63T_7 _1	Exome	SLC44A3	solute carrier family 44; member 3	CCDS7
CGOV63T_7 _1	Exome	SORCS3	sortilin-related VPS10 domain containing receptor 3	CCDS7
CGOV63T_7 _1	Exome	STX11	syntaxin 11	CCDS5
CGOV63T_7 _1	Exome	TARBP1	TAR (HIV-1) RNA binding protein 1	CCDS1
CGOV63T_7 _1	Exome	TP53	tumor protein p53	CCDS1
CGOV63T_7 _1	Exome	TTN	titin	ENST0 38

CGOV63T_7 _1	Exome	UNC13A	protein unc-13 homolog A	NM_00
CGOV63T_7 _1	Exome	UROCI	urocanase domain containing 1	CCDS3
CGOV63T_7 _1	Exome	ZNF462	zinc finger protein 462	CCDS3
CGOV63T_2 _1	Exome	ACVR1C	activin A receptor; type IC	CCDS2
CGOV63T_2 _1	Exome	ATP2B3	ATPase; Ca++ transporting; plasma membrane 3	CCDS3
CGOV63T_2 _1	Exome	C12orf43	chromosome 12 open reading frame 43	CCDS9
CGOV63T_2 _1	Exome	C16orf68	chromosome 16 open reading frame 68	CCDS1
CGOV63T_2 _1	Exome	C1orf174	chromosome 1 open reading frame 174	CCDS5
CGOV63T_2 _1	Exome	C2orf21	Uncharacterized protein C2orf21.	CCDS2
CGOV63T_2 _1	Exome	C9orf152	chromosome 9 open reading frame 152	CCDS3
CGOV63T_2 _1	Exome	CA6	carbonic anhydrase VI	ENST0 74
CGOV63T_2 _1	Exome	CAPRIN2	caprin family member 2	CCDS3
CGOV63T_2 _1	Exome	CAPZA3	capping protein (actin filament) muscle Z-line; alpha 3	CCDS8
CGOV63T_2 _1	Exome	CARD8	caspase recruitment domain family; member 8	ENST0 61
CGOV63T_2 _1	Exome	CDH5	cadherin 5; type 2 (vascular endothelium)	CCDS1
CGOV63T_2 _1	Exome	CEP135	centrosomal protein 135kDa	CCDS3
CGOV63T_2 _1	Exome	CLSPN	claspin homolog (Xenopus laevis)	CCDS3
CGOV63T_2 _1	Exome	CSMD1	CUB and sushi domain- containing protein 1 precursor	NM_03
CGOV63T_2 _1	Exome	CWC22	CWC22 spliceosome- associated protein homolog (S. cerevisiae)	NM_02
CGOV63T_2 _1	Exome	DGKB	diacylglycerol kinase; beta 90kDa	NM_00
CGOV63T_2 _1	Exome	DLEC1	deleted in lung and esophageal cancer 1	CCDS2
CGOV63T_2 _1	Exome	DNAH3	dynein; axonemal; heavy chain 3	CCDS1
CGOV63T_2 _1	Exome	ERBB3	v-erb-b2 erythroblastic leukemia viral oncogene homolog 3 (avian)	CCDS3

CGOV63T_2 _1	Exome	FAM135B	family with sequence similarity 135; member B	CCDS6
CGOV63T_2 _1	Exome	FAM135B	family with sequence similarity 135; member B	CCDS6
CGOV63T_2 _1	Exome	GJB1	gap junction protein; beta 1; 32kDa	CCDS1
CGOV63T_2 _1	Exome	HCK	hemopoietic cell kinase	ENST0 52
CGOV63T_2 _1	Exome	INTS9	integrator complex subunit 9	CCDS3
CGOV63T_2 _1	Exome	KIF13A	kinesin-like protein KIF13A isoform a	NM_02
CGOV63T_2 _1	Exome	LINGO4	leucine rich repeat and Ig domain containing 4	CCDS3
CGOV63T_2 _1	Exome	LRRC15	leucine rich repeat containing 15	CCDS3
CGOV63T_2 _1	Exome	MACF1	microtubule-actin crosslinking factor 1	CCDS4
CGOV63T_2 _1	Exome	NFS1	Cysteine desulfurase, mitochondrial precursor	CCDS1
CGOV63T_2 _1	Exome	NID1	nidogen 1	CCDS1
CGOV63T_2 _1	Exome	OR4F15	olfactory receptor; family 4; subfamily F; member 15	CCDS3
CGOV63T_2 _1	Exome	PHOX2B	paired-like homeobox 2b	CCDS3
CGOV63T_2 _1	Exome	PTPRJ	protein tyrosine phosphatase; receptor type; J	CCDS7
CGOV63T_2 _1	Exome	RDH10	retinol dehydrogenase 10 (all-trans)	CCDS6
CGOV63T_2 _1	Exome	RPS6KA5	ribosomal protein S6 kinase; 90kDa; polypeptide 5	CCDS9
CGOV63T_2 _1	Exome	SEPT6	septin 6	CCDS1
CGOV63T_2 _1	Exome	SFMBT2	Scm-like with four mbt domains 2	CCDS3
CGOV63T_2 _1	Exome	SHH	sonic hedgehog homolog (Drosophila)	CCDS5
CGOV63T_2 _1	Exome	SILV	silver homolog (mouse)	CCDS8
CGOV63T_2 _1	Exome	SLC17A6	solute carrier family 17 (sodium-dependent inorganic phosphate cotransporter); member 6	CCDS7
CGOV63T_2 _1	Exome	SLC44A3	solute carrier family 44; member 3	CCDS7
CGOV63T_2 _1	Exome	SORCS3	sortilin-related VPS10 domain containing receptor 3	CCDS7

CGOV63T_2 _1	Exome	STX11	syntaxin 11	CCDS5
CGOV63T_2 _1	Exome	TARBP1	TAR (HIV-1) RNA binding protein 1	CCDS1
CGOV63T_2 _1	Exome	TP53	tumor protein p53	CCDS1
CGOV63T_2 _1	Exome	TTN	titin	ENST0 38
CGOV63T_2 _1	Exome	UNC13A	protein unc-13 homolog A	NM_00
CGOV63T_2 _1	Exome	UROC1	urocanase domain containing 1	CCDS3
CGOV63T_2 _1	Exome	ZNF462	zinc finger protein 462	CCDS3
CGOV63T_1 4	Exome	CAPZA3	capping protein (actin filament) muscle Z-line; alpha 3	CCDS8
CGOV63T_1 4	Exome	MACF1	microtubule-actin crosslinking factor 1	CCDS4
CGOV63T_1 4	Exome	SILV	silver homolog (mouse)	CCDS8
CGOV63T_1 4	Exome	TP53	tumor protein p53	CCDS1
CGOV63T_1 4	Exome	ACVR1C	activin A receptor; type IC	CCDS2
CGOV63T_1 4	Exome	ATP2B3	ATPase; Ca++ transporting; plasma membrane 3	CCDS3
CGOV63T_1 4	Exome	C12orf43	chromosome 12 open reading frame 43	CCDS9
CGOV63T_1 4	Exome	C1orf174	chromosome 1 open reading frame 174	CCDS5
CGOV63T_1 4	Exome	C2orf21	Uncharacterized protein C2orf21.	CCDS2
CGOV63T_1 4	Exome	C9orf152	chromosome 9 open reading frame 152	CCDS3
CGOV63T_1 4	Exome	CA6	carbonic anhydrase VI	ENST0 74
CGOV63T_1 4	Exome	CAPRIN2	caprin family member 2	CCDS3
CGOV63T_1 4	Exome	CARD8	caspase recruitment domain family; member 8	ENST0 61
CGOV63T_1 4	Exome	CDH5	cadherin 5; type 2 (vascular endothelium)	CCDS1
CGOV63T_1 4	Exome	CEP135	centrosomal protein 135kDa	CCDS3
CGOV63T_1 4	Exome	CLSPN	claspin homolog (Xenopus laevis)	CCDS3
CGOV63T_1 4	Exome	CSMD1	CUB and sushi domain- containing protein 1 precursor	NM_03

CGOV63T_1 4	Exome	CWC22	CWC22 spliceosome-associated protein homolog (S. cerevisiae)	NM_02
CGOV63T_1 4	Exome	DGKB	diacylglycerol kinase; beta 90kDa	NM_00
CGOV63T_1 4	Exome	DLEC1	deleted in lung and esophageal cancer 1	CCDS2
CGOV63T_1 4	Exome	DNAH3	dynein; axonemal; heavy chain 3	CCDS1
CGOV63T_1 4	Exome	ERBB3	v-erb-b2 erythroblastic leukemia viral oncogene homolog 3 (avian)	CCDS3
CGOV63T_1 4	Exome	FAM135B	family with sequence similarity 135; member B	CCDS6
CGOV63T_1 4	Exome	FAM135B	family with sequence similarity 135; member B	CCDS6
CGOV63T_1 4	Exome	GJB1	gap junction protein; beta 1; 32kDa	CCDS1
CGOV63T_1 4	Exome	HCK	hemopoietic cell kinase	ENST0 52
CGOV63T_1 4	Exome	INTS9	integrator complex subunit 9	CCDS3
CGOV63T_1 4	Exome	KIF13A	kinesin-like protein KIF13A isoform a	NM_02
CGOV63T_1 4	Exome	LINGO4	leucine rich repeat and Ig domain containing 4	CCDS3
CGOV63T_1 4	Exome	LRRC15	leucine rich repeat containing 15	CCDS3
CGOV63T_1 4	Exome	NFS1	Cysteine desulfurase, mitochondrial precursor	CCDS1
CGOV63T_1 4	Exome	NID1	nidogen 1	CCDS1
CGOV63T_1 4	Exome	OR4F15	olfactory receptor; family 4; subfamily F; member 15	CCDS3
CGOV63T_1 4	Exome	PHOX2B	paired-like homeobox 2b	CCDS3
CGOV63T_1 4	Exome	PTPRJ	protein tyrosine phosphatase; receptor type; J	CCDS7
CGOV63T_1 4	Exome	RDH10	retinol dehydrogenase 10 (all-trans)	CCDS6
CGOV63T_1 4	Exome	RPS6KA5	ribosomal protein S6 kinase; 90kDa; polypeptide 5	CCDS9
CGOV63T_1 4	Exome	SEPT6	septin 6	CCDS1
CGOV63T_1 4	Exome	SFMBT2	Scm-like with four mbt domains 2	CCDS3
CGOV63T_1 4	Exome	SHH	sonic hedgehog homolog (Drosophila)	CCDS5
CGOV63T_1 4	Exome	SLC17A6	solute carrier family 17 (sodium-dependent	CCDS7

CGOV63T_1 4	Exome	SLC44A3	inorganic phosphate cotransporter); member 6 solute carrier family 44; member 3	CCDS7
CGOV63T_1 4	Exome	SORCS3	sortilin-related VPS10 domain containing receptor 3	CCDS7
CGOV63T_1 4	Exome	STX11	syntaxin 11	CCDS5
CGOV63T_1 4	Exome	TARBP1	TAR (HIV-1) RNA binding protein 1	CCDS1
CGOV63T_1 4	Exome	TTN	titin	ENST0 38
CGOV63T_1 4	Exome	UNC13A	protein unc-13 homolog A	NM_00
CGOV63T_1 4	Exome	UROC1	urocanase domain containing 1	CCDS3
CGOV63T_1 4	Exome	ZNF462	zinc finger protein 462	CCDS3
CGOV63T_1 2	Exome	ACVR1C	activin A receptor; type IC	CCDS2
CGOV63T_1 2	Exome	ATP2B3	ATPase; Ca <sup>++</sup> transporting; plasma membrane 3	CCDS3
CGOV63T_1 2	Exome	C12orf43	chromosome 12 open reading frame 43	CCDS9
CGOV63T_1 2	Exome	C16orf68	chromosome 16 open reading frame 68	CCDS1
CGOV63T_1 2	Exome	C1orf174	chromosome 1 open reading frame 174	CCDS5
CGOV63T_1 2	Exome	C2orf21	Uncharacterized protein C2orf21.	CCDS2
CGOV63T_1 2	Exome	C9orf152	chromosome 9 open reading frame 152	CCDS3
CGOV63T_1 2	Exome	CA6	carbonic anhydrase VI	ENST0 74
CGOV63T_1 2	Exome	CAPRIN2	caprin family member 2	CCDS3
CGOV63T_1 2	Exome	CAPZA3	capping protein (actin filament) muscle Z-line; alpha 3	CCDS8
CGOV63T_1 2	Exome	CARD8	caspase recruitment domain family; member 8	ENST0 61
CGOV63T_1 2	Exome	CDH5	cadherin 5; type 2 (vascular endothelium)	CCDS1
CGOV63T_1 2	Exome	CEP135	centrosomal protein 135kDa	CCDS3
CGOV63T_1 2	Exome	CLSPN	claspin homolog (Xenopus laevis)	CCDS3
CGOV63T_1 2	Exome	CSMD1	CUB and sushi domain- containing protein 1 precursor	NM_03

CGOV63T_1 2	Exome	CWC22	CWC22 spliceosome-associated protein homolog (S. cerevisiae)	NM_02
CGOV63T_1 2	Exome	DGKB	diacylglycerol kinase; beta 90kDa	NM_00
CGOV63T_1 2	Exome	DLEC1	deleted in lung and esophageal cancer 1	CCDS2
CGOV63T_1 2	Exome	DNAH3	dynein; axonemal; heavy chain 3	CCDS1
CGOV63T_1 2	Exome	ERBB3	v-erb-b2 erythroblastic leukemia viral oncogene homolog 3 (avian)	CCDS3
CGOV63T_1 2	Exome	FAM135B	family with sequence similarity 135; member B	CCDS6
CGOV63T_1 2	Exome	FAM135B	family with sequence similarity 135; member B	CCDS6
CGOV63T_1 2	Exome	GJB1	gap junction protein; beta 1; 32kDa	CCDS1
CGOV63T_1 2	Exome	HCK	hemopoietic cell kinase	ENST0 52
CGOV63T_1 2	Exome	IGF2R	insulin-like growth factor 2 receptor	CCDS5
CGOV63T_1 2	Exome	INTS9	integrator complex subunit 9	CCDS3
CGOV63T_1 2	Exome	KIF13A	kinesin-like protein KIF13A isoform a	NM_02
CGOV63T_1 2	Exome	LINGO4	leucine rich repeat and Ig domain containing 4	CCDS3
CGOV63T_1 2	Exome	LRRC15	leucine rich repeat containing 15	CCDS3
CGOV63T_1 2	Exome	MACF1	microtubule-actin crosslinking factor 1	CCDS4
CGOV63T_1 2	Exome	NFS1	Cysteine desulfurase, mitochondrial precursor	CCDS1
CGOV63T_1 2	Exome	NID1	nidogen 1	CCDS1
CGOV63T_1 2	Exome	OR4F15	olfactory receptor; family 4; subfamily F; member 15	CCDS3
CGOV63T_1 2	Exome	PHOX2B	paired-like homeobox 2b	CCDS3
CGOV63T_1 2	Exome	PTPRJ	protein tyrosine phosphatase; receptor type; J	CCDS7
CGOV63T_1 2	Exome	RDH10	retinol dehydrogenase 10 (all-trans)	CCDS6
CGOV63T_1 2	Exome	RPS6KA5	ribosomal protein S6 kinase; 90kDa; polypeptide 5	CCDS9
CGOV63T_1 2	Exome	SEPT6	septin 6	CCDS1
CGOV63T_1 2	Exome	SFMBT2	Scm-like with four mbt domains 2	CCDS3

CGOV63T_1 2	Exome	SHH	sonic hedgehog homolog (Drosophila)	CCDS5
CGOV63T_1 2	Exome	SILV	silver homolog (mouse)	CCDS8
CGOV63T_1 2	Exome	SLC17A6	solute carrier family 17 (sodium-dependent inorganic phosphate cotransporter); member 6	CCDS7
CGOV63T_1 2	Exome	SLC44A3	solute carrier family 44; member 3	CCDS7
CGOV63T_1 2	Exome	SORCS3	sortilin-related VPS10 domain containing receptor 3	CCDS7
CGOV63T_1 2	Exome	STX11	syntaxin 11	CCDS5
CGOV63T_1 2	Exome	TARBP1	TAR (HIV-1) RNA binding protein 1	CCDS1
CGOV63T_1 2	Exome	TP53	tumor protein p53	CCDS1
CGOV63T_1 2	Exome	TTN	titin	ENST0 38
CGOV63T_1 2	Exome	UNC13A	protein unc-13 homolog A	NM_00
CGOV63T_1 2	Exome	UROC1	urocanase domain containing 1	CCDS3
CGOV63T_1 2	Exome	ZNF462	zinc finger protein 462	CCDS3
CGOV63T_1 0	Exome	ATP2B3	ATPase; Ca++ transporting; plasma membrane 3	CCDS3
CGOV63T_1 0	Exome	C12orf43	chromosome 12 open reading frame 43	CCDS9
CGOV63T_1 0	Exome	CAPZA3	capping protein (actin filament) muscle Z-line; alpha 3	CCDS8
CGOV63T_1 0	Exome	CLSPN	claspin homolog (Xenopus laevis)	CCDS3
CGOV63T_1 0	Exome	CSMD1	CUB and sushi domain- containing protein 1 precursor	NM_03
CGOV63T_1 0	Exome	DGKB	diacylglycerol kinase; beta 90kDa	NM_00
CGOV63T_1 0	Exome	FAM135B	family with sequence similarity 135; member B	CCDS6
CGOV63T_1 0	Exome	HCK	hemopoietic cell kinase	ENST0 52
CGOV63T_1 0	Exome	KIF13A	kinesin-like protein KIF13A isoform a	NM_02
CGOV63T_1 0	Exome	LINGO4	leucine rich repeat and Ig domain containing 4	CCDS3
CGOV63T_1 0	Exome	LRRC15	leucine rich repeat containing 15	CCDS3

CGOV63T_1 0	Exome	MACF1	microtubule-actin crosslinking factor 1	CCDS4
CGOV63T_1 0	Exome	NID1	nidogen 1	CCDS1
CGOV63T_1 0	Exome	RPS6KA5	ribosomal protein S6 kinase; 90kDa; polypeptide 5	CCDS9
CGOV63T_1 0	Exome	SEPT6	septin 6	CCDS1
CGOV63T_1 0	Exome	SFMBT2	Scm-like with four mbt domains 2	CCDS3
CGOV63T_1 0	Exome	SILV	silver homolog (mouse)	CCDS8
CGOV63T_1 0	Exome	TP53	tumor protein p53	CCDS1
CGOV62T_9	Exome	ANKFN1	ankyrin-repeat and fibronectin type III domain containing 1	CCDS3
CGOV62T_9	Exome	ANKRD35	ankyrin repeat domain 35	CCDS9
CGOV62T_9	Exome	APOB	apolipoprotein B (including Ag(x) antigen)	CCDS1
CGOV62T_9	Exome	BTNL9	butyrophilin-like 9	CCDS4
CGOV62T_9	Exome	C1S	complement component 1; s subcomponent	CCDS3
CGOV62T_9	Exome	C4orf43	chromosome 4 open reading frame 43	CCDS4
CGOV62T_9	Exome	C5orf25	chromosome 5 open reading frame 25	CCDS4
CGOV62T_9	Exome	C5orf46	chromosome 5 open reading frame 46	CCDS3
CGOV62T_9	Exome	C6	complement component 6	CCDS3
CGOV62T_9	Exome	CDKAL1	CDK5 regulatory subunit associated protein 1-like 1	CCDS4
CGOV62T_9	Exome	DNAH6	dynein heavy chain 6, axonemal	NM_00
CGOV62T_9	Exome	DUSP27	dual specificity phosphatase 27 (putative)	CCDS3
CGOV62T_9	Exome	EPHA5	EPH receptor A5	CCDS3
CGOV62T_9	Exome	FAM5C	family with sequence similarity 5; member C	CCDS1
CGOV62T_9	Exome	KIF17	kinesin family member 17	CCDS2
CGOV62T_9	Exome	KIF3C	kinesin family member 3C	CCDS1
CGOV62T_9	Exome	PRSS23	protease; serine; 23	CCDS4
CGOV62T_9	Exome	RANBP2	RAN binding protein 2	CCDS2

CGOV62T_9	Exome	RHBDD1	rhomboid domain containing 1	CCDS2
CGOV62T_9	Exome	ROBO1	roundabout homolog 1 isoform a precursor	NM_00
CGOV62T_9	Exome	SEMA3F	sema domain; immunoglobulin domain (Ig); short basic domain; secreted; (semaphorin) 3F	CCDS2
CGOV62T_9	Exome	SI	sucrase-isomaltase (alpha-glucosidase)	CCDS3
CGOV62T_9	Exome	SLC1A2	solute carrier family 1 (glial high affinity glutamate transporter); member 2	CCDS3
CGOV62T_9	Exome	SLC25A3	solute carrier family 25 (mitochondrial carrier; phosphate carrier); member 3	CCDS9
CGOV62T_9	Exome	TP53	tumor protein p53	CCDS1
CGOV62T_9	Exome	TRIO	triple functional domain (PTPRF interacting)	CCDS3
CGOV62T_9	Exome	USP34	ubiquitin specific peptidase 34	CCDS4
CGOV62T_9	Exome	WDR11	WD repeat domain 11	CCDS7
CGOV62T_9	Exome	ZBBX	zinc finger; B-box domain containing	CCDS3
CGOV62T_9	Exome	ZNF71	zinc finger protein 71	CCDS1
CGOV62T_8	Exome	ANKFN1	ankyrin-repeat and fibronectin type III domain containing 1	CCDS3
CGOV62T_8	Exome	ANKRD35	ankyrin repeat domain 35	CCDS9
CGOV62T_8	Exome	APOB	apolipoprotein B (including Ag(x) antigen)	CCDS1
CGOV62T_8	Exome	BTNL9	butyrophilin-like 9	CCDS4
CGOV62T_8	Exome	C1S	complement component 1; s subcomponent	CCDS3
CGOV62T_8	Exome	C4orf43	chromosome 4 open reading frame 43	CCDS4
CGOV62T_8	Exome	C5orf25	chromosome 5 open reading frame 25	CCDS4
CGOV62T_8	Exome	C5orf46	chromosome 5 open reading frame 46	CCDS3
CGOV62T_8	Exome	C6	complement component 6	CCDS3
CGOV62T_8	Exome	CDKAL1	CDK5 regulatory subunit associated protein 1-like 1	CCDS4

CGOV62T_8	Exome	DNAH6	dynein heavy chain 6, axonemal	NM_00
CGOV62T_8	Exome	DUSP27	dual specificity phosphatase 27 (putative)	CCDS3
CGOV62T_8	Exome	EPHA5	EPH receptor A5	CCDS3
CGOV62T_8	Exome	FAM5C	family with sequence similarity 5; member C	CCDS1
CGOV62T_8	Exome	KIF17	kinesin family member 17	CCDS2
CGOV62T_8	Exome	KIF3C	kinesin family member 3C	CCDS1
CGOV62T_8	Exome	PRSS23	protease; serine; 23	CCDS4
CGOV62T_8	Exome	RANBP2	RAN binding protein 2	CCDS2
CGOV62T_8	Exome	RHBDD1	rhomboid domain containing 1	CCDS2
CGOV62T_8	Exome	ROBO1	roundabout homolog 1 isoform a precursor	NM_00
CGOV62T_8	Exome	SEMA3F	sema domain; immunoglobulin domain (Ig); short basic domain; secreted; (semaphorin) 3F	CCDS2
CGOV62T_8	Exome	SI	sucrase-isomaltase (alpha-glucosidase)	CCDS3
CGOV62T_8	Exome	SLC1A2	solute carrier family 1 (glial high affinity glutamate transporter); member 2	CCDS3
CGOV62T_8	Exome	SLC25A3	solute carrier family 25 (mitochondrial carrier; phosphate carrier); member 3	CCDS9
CGOV62T_8	Exome	TP53	tumor protein p53	CCDS1
CGOV62T_8	Exome	TRIO	triple functional domain (PTPRF interacting)	CCDS3
CGOV62T_8	Exome	USP34	ubiquitin specific peptidase 34	CCDS4
CGOV62T_8	Exome	WDR11	WD repeat domain 11	CCDS7
CGOV62T_8	Exome	ZBBX	zinc finger; B-box domain containing	CCDS3
CGOV62T_8	Exome	ZNF71	zinc finger protein 71	CCDS1
CGOV62T_7	Exome	ANKFN1	ankyrin-repeat and fibronectin type III domain containing 1	CCDS3
CGOV62T_7	Exome	ANKRD35	ankyrin repeat domain 35	CCDS9

CGOV62T_7	Exome	APOB	apolipoprotein B (including Ag(x) antigen)	CCDS1
CGOV62T_7	Exome	BTNL9	butyrophilin-like 9	CCDS4
CGOV62T_7	Exome	C1S	complement component 1; s subcomponent	CCDS3
CGOV62T_7	Exome	C4orf43	chromosome 4 open reading frame 43	CCDS4
CGOV62T_7	Exome	C5orf25	chromosome 5 open reading frame 25	CCDS4
CGOV62T_7	Exome	C5orf46	chromosome 5 open reading frame 46	CCDS3
CGOV62T_7	Exome	C6	complement component 6	CCDS3
CGOV62T_7	Exome	CDKAL1	CDK5 regulatory subunit associated protein 1-like 1	CCDS4
CGOV62T_7	Exome	DNAH6	dynein heavy chain 6, axonemal	NM_00
CGOV62T_7	Exome	DUSP27	dual specificity phosphatase 27 (putative)	CCDS3
CGOV62T_7	Exome	EPHA5	EPH receptor A5	CCDS3
CGOV62T_7	Exome	FAM5C	family with sequence similarity 5; member C	CCDS1
CGOV62T_7	Exome	KIF17	kinesin family member 17	CCDS2
CGOV62T_7	Exome	KIF3C	kinesin family member 3C	CCDS1
CGOV62T_7	Exome	PRSS23	protease; serine; 23	CCDS4
CGOV62T_7	Exome	RANBP2	RAN binding protein 2	CCDS2
CGOV62T_7	Exome	RHBDD1	rhomboid domain containing 1	CCDS2
CGOV62T_7	Exome	ROBO1	roundabout homolog 1 isoform a precursor	NM_00
CGOV62T_7	Exome	SEMA3F	sema domain; immunoglobulin domain (Ig); short basic domain; secreted; (semaphorin) 3F	CCDS2
CGOV62T_7	Exome	SI	sucrase-isomaltase (alpha-glucosidase)	CCDS3
CGOV62T_7	Exome	SLC1A2	solute carrier family 1 (glial high affinity glutamate transporter); member 2	CCDS3
CGOV62T_7	Exome	SLC25A3	solute carrier family 25 (mitochondrial carrier; phosphate carrier); member 3	CCDS9
CGOV62T_7	Exome	TP53	tumor protein p53	CCDS1

CGOV62T_7	Exome	TRIO	triple functional domain (PTPRF interacting)	CCDS3
CGOV62T_7	Exome	USP34	ubiquitin specific peptidase 34	CCDS4
CGOV62T_7	Exome	WDR11	WD repeat domain 11	CCDS7
CGOV62T_7	Exome	ZBBX	zinc finger; B-box domain containing	CCDS3
CGOV62T_7	Exome	ZNF71	zinc finger protein 71	CCDS1
CGOV62T_6	Exome	ANKFN1	ankyrin-repeat and fibronectin type III domain containing 1	CCDS3
CGOV62T_6	Exome	ANKRD35	ankyrin repeat domain 35	CCDS9
CGOV62T_6	Exome	APOB	apolipoprotein B (including Ag(x) antigen)	CCDS1
CGOV62T_6	Exome	BTNL9	butyrophilin-like 9	CCDS4
CGOV62T_6	Exome	C1S	complement component 1; s subcomponent	CCDS3
CGOV62T_6	Exome	C4orf43	chromosome 4 open reading frame 43	CCDS4
CGOV62T_6	Exome	C5orf25	chromosome 5 open reading frame 25	CCDS4
CGOV62T_6	Exome	C5orf46	chromosome 5 open reading frame 46	CCDS3
CGOV62T_6	Exome	C6	complement component 6	CCDS3
CGOV62T_6	Exome	CDKAL1	CDK5 regulatory subunit associated protein 1-like 1	CCDS4
CGOV62T_6	Exome	DNAH6	dynein heavy chain 6, axonemal	NM_00
CGOV62T_6	Exome	DUSP27	dual specificity phosphatase 27 (putative)	CCDS3
CGOV62T_6	Exome	EPHA5	EPH receptor A5	CCDS3
CGOV62T_6	Exome	FAM5C	family with sequence similarity 5; member C	CCDS1
CGOV62T_6	Exome	KIF17	kinesin family member 17	CCDS2
CGOV62T_6	Exome	KIF3C	kinesin family member 3C	CCDS1
CGOV62T_6	Exome	PRSS23	protease; serine; 23	CCDS4
CGOV62T_6	Exome	RANBP2	RAN binding protein 2	CCDS2
CGOV62T_6	Exome	RHBDD1	rhomboid domain containing 1	CCDS2
CGOV62T_6	Exome	ROBO1	roundabout homolog 1 isoform a precursor	NM_00

		SEMA3F	sema domain; immunoglobulin domain (Ig); short basic domain; secreted; (semaphorin) 3F	CCDS2
CGOV62T_6	Exome			
CGOV62T_6	Exome	SI	sucrase-isomaltase (alpha- glucosidase)	CCDS3
		SLC1A2	solute carrier family 1 (glial high affinity glutamate transporter); member 2	CCDS3
CGOV62T_6	Exome			
		SLC25A3	solute carrier family 25 (mitochondrial carrier; phosphate carrier); member 3	CCDS9
CGOV62T_6	Exome			
CGOV62T_6	Exome	TP53	tumor protein p53	CCDS1
		TRIO	triple functional domain (PTPRF interacting)	CCDS3
CGOV62T_6	Exome			
CGOV62T_6	Exome	USP34	ubiquitin specific peptidase 34	CCDS4
		WDR11	WD repeat domain 11	CCDS7
CGOV62T_6	Exome			
CGOV62T_6	Exome	ZBBX	zinc finger; B-box domain containing	CCDS3
		ZNF71	zinc finger protein 71	CCDS1
CGOV62T_6	Exome			
		ANKFN1	ankyrin-repeat and fibronectin type III domain containing 1	CCDS3
CGOV62T_4	Exome			
CGOV62T_4	Exome	ANKRD35	ankyrin repeat domain 35	CCDS9
		C5orf25	chromosome 5 open reading frame 25	CCDS4
CGOV62T_4	Exome			
CGOV62T_4	Exome	C5orf46	chromosome 5 open reading frame 46	CCDS3
		EPHA5	EPH receptor A5	CCDS3
CGOV62T_4	Exome			
CGOV62T_4	Exome	SI	sucrase-isomaltase (alpha- glucosidase)	CCDS3
		SLC25A3	solute carrier family 25 (mitochondrial carrier; phosphate carrier); member 3	CCDS9
CGOV62T_4	Exome			
CGOV62T_4	Exome	TP53	tumor protein p53	CCDS1
		TRIO	triple functional domain (PTPRF interacting)	CCDS3
CGOV62T_4	Exome			
CGOV62T_4	Exome	WDR11	WD repeat domain 11	CCDS7
		ZNF71	zinc finger protein 71	CCDS1
CGOV62T_4	Exome			

CGOV62T_3_1	Exome	ANKFN1	ankyrin-repeat and fibronectin type III domain containing 1	CCDS3
CGOV62T_3_1	Exome	ANKRD35	ankyrin repeat domain 35	CCDS9
CGOV62T_3_1	Exome	APOB	apolipoprotein B (including Ag(x) antigen)	CCDS1
CGOV62T_3_1	Exome	BTNL9	butyrophilin-like 9	CCDS4
CGOV62T_3_1	Exome	C1S	complement component 1; s subcomponent	CCDS3
CGOV62T_3_1	Exome	C4orf43	chromosome 4 open reading frame 43	CCDS4
CGOV62T_3_1	Exome	C5orf25	chromosome 5 open reading frame 25	CCDS4
CGOV62T_3_1	Exome	C5orf46	chromosome 5 open reading frame 46	CCDS3
CGOV62T_3_1	Exome	C6	complement component 6	CCDS3
CGOV62T_3_1	Exome	CDKAL1	CDK5 regulatory subunit associated protein 1-like 1	CCDS4
CGOV62T_3_1	Exome	DNAH6	dynein heavy chain 6, axonemal	NM_00
CGOV62T_3_1	Exome	DUSP27	dual specificity phosphatase 27 (putative)	CCDS3
CGOV62T_3_1	Exome	EPHA5	EPH receptor A5	CCDS3
CGOV62T_3_1	Exome	FAM5C	family with sequence similarity 5; member C	CCDS1
CGOV62T_3_1	Exome	KIF17	kinesin family member 17	CCDS2
CGOV62T_3_1	Exome	KIF3C	kinesin family member 3C	CCDS1
CGOV62T_3_1	Exome	PRSS23	protease; serine; 23	CCDS4
CGOV62T_3_1	Exome	RANBP2	RAN binding protein 2	CCDS2
CGOV62T_3_1	Exome	RHBDD1	rhomboid domain containing 1	CCDS2
CGOV62T_3_1	Exome	ROBO1	roundabout homolog 1 isoform a precursor	NM_00
CGOV62T_3_1	Exome	SEMA3F	sema domain; immunoglobulin domain (Ig); short basic domain; secreted; (semaphorin) 3F	CCDS2
CGOV62T_3_1	Exome	SI	sucrase-isomaltase (alpha-glucosidase)	CCDS3
CGOV62T_3_1	Exome	SLC1A2	solute carrier family 1 (glial high affinity glutamate transporter); member 2	CCDS3

CGOV62T_3_1	Exome	SLC25A3	solute carrier family 25 (mitochondrial carrier; phosphate carrier); member 3	CCDS9
CGOV62T_3_1	Exome	TP53	tumor protein p53	CCDS1
CGOV62T_3_1	Exome	TRIO	triple functional domain (PTPRF interacting)	CCDS3
CGOV62T_3_1	Exome	USP34	ubiquitin specific peptidase 34	CCDS4
CGOV62T_3_1	Exome	WDR11	WD repeat domain 11	CCDS7
CGOV62T_3_1	Exome	ZBBX	zinc finger; B-box domain containing	CCDS3
CGOV62T_3_1	Exome	ZNF71	zinc finger protein 71	CCDS1
CGOV62T_2	Exome	ANKFN1	ankyrin-repeat and fibronectin type III domain containing 1	CCDS3
CGOV62T_2	Exome	ANKRD35	ankyrin repeat domain 35	CCDS9
CGOV62T_2	Exome	APOB	apolipoprotein B (including Ag(x) antigen)	CCDS1
CGOV62T_2	Exome	BTNL9	butyrophilin-like 9	CCDS4
CGOV62T_2	Exome	C1S	complement component 1; s subcomponent	CCDS3
CGOV62T_2	Exome	C4orf43	chromosome 4 open reading frame 43	CCDS4
CGOV62T_2	Exome	C5orf25	chromosome 5 open reading frame 25	CCDS4
CGOV62T_2	Exome	C5orf46	chromosome 5 open reading frame 46	CCDS3
CGOV62T_2	Exome	C6	complement component 6	CCDS3
CGOV62T_2	Exome	CDKAL1	CDK5 regulatory subunit associated protein 1-like 1	CCDS4
CGOV62T_2	Exome	DNAH6	dynein heavy chain 6, axonemal	NM_00
CGOV62T_2	Exome	DUSP27	dual specificity phosphatase 27 (putative)	CCDS3
CGOV62T_2	Exome	EPHA5	EPH receptor A5	CCDS3
CGOV62T_2	Exome	FAM5C	family with sequence similarity 5; member C	CCDS1
CGOV62T_2	Exome	KIF17	kinesin family member 17	CCDS2
CGOV62T_2	Exome	KIF3C	kinesin family member 3C	CCDS1
CGOV62T_2	Exome	PRSS23	protease; serine; 23	CCDS4

CGOV62T_2	Exome	RANBP2	RAN binding protein 2	CCDS2
CGOV62T_2	Exome	RHBDD1	rhomboid domain containing 1	CCDS2
CGOV62T_2	Exome	ROBO1	roundabout homolog 1 isoform a precursor	NM_00
CGOV62T_2	Exome	SEMA3F	sema domain; immunoglobulin domain (Ig); short basic domain; secreted; (semaphorin) 3F	CCDS2
CGOV62T_2	Exome	SI	sucrase-isomaltase (alpha-glucosidase)	CCDS3
CGOV62T_2	Exome	SLC1A2	solute carrier family 1 (glial high affinity glutamate transporter); member 2	CCDS3
CGOV62T_2	Exome	SLC25A3	solute carrier family 25 (mitochondrial carrier; phosphate carrier); member 3	CCDS9
CGOV62T_2	Exome	TP53	tumor protein p53	CCDS1
CGOV62T_2	Exome	TRIO	triple functional domain (PTPRF interacting)	CCDS3
CGOV62T_2	Exome	USP34	ubiquitin specific peptidase 34	CCDS4
CGOV62T_2	Exome	WDR11	WD repeat domain 11	CCDS7
CGOV62T_2	Exome	ZBBX	zinc finger; B-box domain containing	CCDS3
CGOV62T_2	Exome	ZNF71	zinc finger protein 71	CCDS1
CGOV62T_1 0	Exome	ANKFN1	ankyrin-repeat and fibronectin type III domain containing 1	CCDS3
CGOV62T_1 0	Exome	ANKRD35	ankyrin repeat domain 35	CCDS9
CGOV62T_1 0	Exome	APOB	apolipoprotein B (including Ag(x) antigen)	CCDS1
CGOV62T_1 0	Exome	BTNL9	butyrophilin-like 9	CCDS4
CGOV62T_1 0	Exome	C1S	complement component 1; s subcomponent	CCDS3
CGOV62T_1 0	Exome	C4orf43	chromosome 4 open reading frame 43	CCDS4
CGOV62T_1 0	Exome	C5orf25	chromosome 5 open reading frame 25	CCDS4
CGOV62T_1 0	Exome	C5orf46	chromosome 5 open reading frame 46	CCDS3
CGOV62T_1 0	Exome	C6	complement component 6	CCDS3

CGOV62T_1 0	Exome	CDKAL1	CDK5 regulatory subunit associated protein 1-like 1	CCDS4
CGOV62T_1 0	Exome	DNAH6	dynein heavy chain 6, axonemal	NM_00
CGOV62T_1 0	Exome	DUSP27	dual specificity phosphatase 27 (putative)	CCDS3
CGOV62T_1 0	Exome	EPHA5	EPH receptor A5	CCDS3
CGOV62T_1 0	Exome	FAM5C	family with sequence similarity 5; member C	CCDS1
CGOV62T_1 0	Exome	KIF17	kinesin family member 17	CCDS2
CGOV62T_1 0	Exome	KIF3C	kinesin family member 3C	CCDS1
CGOV62T_1 0	Exome	PRSS23	protease; serine; 23	CCDS4
CGOV62T_1 0	Exome	RANBP2	RAN binding protein 2	CCDS2
CGOV62T_1 0	Exome	RHBDD1	rhomboid domain containing 1	CCDS2
CGOV62T_1 0	Exome	ROBO1	roundabout homolog 1 isoform a precursor	NM_00
CGOV62T_1 0	Exome	SEMA3F	sema domain; immunoglobulin domain (Ig); short basic domain; secreted; (semaphorin) 3F	CCDS2
CGOV62T_1 0	Exome	SI	sucrase-isomaltase (alpha-glucosidase)	CCDS3
CGOV62T_1 0	Exome	SLC1A2	solute carrier family 1 (glial high affinity glutamate transporter); member 2	CCDS3
CGOV62T_1 0	Exome	SLC25A3	solute carrier family 25 (mitochondrial carrier; phosphate carrier); member 3	CCDS9
CGOV62T_1 0	Exome	TP53	tumor protein p53	CCDS1
CGOV62T_1 0	Exome	TRIO	triple functional domain (PTPRF interacting)	CCDS3
CGOV62T_1 0	Exome	USP34	ubiquitin specific peptidase 34	CCDS4
CGOV62T_1 0	Exome	WDR11	WD repeat domain 11	CCDS7
CGOV62T_1 0	Exome	ZBBX	zinc finger; B-box domain containing	CCDS3
CGOV62T_1 0	Exome	ZNF71	zinc finger protein 71	CCDS1
CGOV62T_1	Exome	ANKFN1	ankyrin-repeat and fibronectin type III domain containing 1	CCDS3

CGOV62T_1	Exome	ANKRD35	ankyrin repeat domain 35	CCDS9
CGOV62T_1	Exome	APOB	apolipoprotein B (including Ag(x) antigen)	CCDS1
CGOV62T_1	Exome	BTNL9	butyrophilin-like 9	CCDS4
CGOV62T_1	Exome	C1S	complement component 1; s subcomponent	CCDS3
CGOV62T_1	Exome	C4orf43	chromosome 4 open reading frame 43	CCDS4
CGOV62T_1	Exome	C5orf25	chromosome 5 open reading frame 25	CCDS4
CGOV62T_1	Exome	C5orf46	chromosome 5 open reading frame 46	CCDS3
CGOV62T_1	Exome	C6	complement component 6	CCDS3
CGOV62T_1	Exome	CDKAL1	CDK5 regulatory subunit associated protein 1-like 1	CCDS4
CGOV62T_1	Exome	DNAH6	dynein heavy chain 6, axonemal	NM_00
CGOV62T_1	Exome	DUSP27	dual specificity phosphatase 27 (putative)	CCDS3
CGOV62T_1	Exome	EPHA5	EPH receptor A5	CCDS3
CGOV62T_1	Exome	FAM5C	family with sequence similarity 5; member C	CCDS1
CGOV62T_1	Exome	KIF17	kinesin family member 17	CCDS2
CGOV62T_1	Exome	KIF3C	kinesin family member 3C	CCDS1
CGOV62T_1	Exome	PRSS23	protease; serine; 23	CCDS4
CGOV62T_1	Exome	RANBP2	RAN binding protein 2	CCDS2
CGOV62T_1	Exome	RHBDD1	rhomboid domain containing 1	CCDS2
CGOV62T_1	Exome	ROBO1	roundabout homolog 1 isoform a precursor	NM_00
CGOV62T_1	Exome	SEMA3F	sema domain; immunoglobulin domain (Ig); short basic domain; secreted; (semaphorin) 3F	CCDS2
CGOV62T_1	Exome	SI	sucrase-isomaltase (alpha-glucosidase)	CCDS3
CGOV62T_1	Exome	SLC1A2	solute carrier family 1 (glial high affinity glutamate transporter); member 2	CCDS3
CGOV62T_1	Exome	SLC25A3	solute carrier family 25 (mitochondrial carrier; phosphate carrier); member 3	CCDS9

CGOV62T_1	Exome	TP53	tumor protein p53	CCDS1
CGOV62T_1	Exome	TRIO	triple functional domain (PTPRF interacting)	CCDS3
CGOV62T_1	Exome	USP34	ubiquitin specific peptidase 34	CCDS4
CGOV62T_1	Exome	WDR11	WD repeat domain 11	CCDS7
CGOV62T_1	Exome	ZBBX	zinc finger; B-box domain containing	CCDS3
CGOV62T_1	Exome	ZNF71	zinc finger protein 71	CCDS1
CGOV62T	Exome	ANKFN1	ankyrin-repeat and fibronectin type III domain containing 1	CCDS3
CGOV62T	Exome	ANKRD35	ankyrin repeat domain 35	CCDS9
CGOV62T	Exome	APOB	apolipoprotein B (including Ag(x) antigen)	CCDS1
CGOV62T	Exome	BTNL9	butyrophilin-like 9	CCDS4
CGOV62T	Exome	C1S	complement component 1; s subcomponent	CCDS3
CGOV62T	Exome	C4orf43	chromosome 4 open reading frame 43	CCDS4
CGOV62T	Exome	C5orf25	chromosome 5 open reading frame 25	CCDS4
CGOV62T	Exome	C5orf46	chromosome 5 open reading frame 46	CCDS3
CGOV62T	Exome	C6	complement component 6	CCDS3
CGOV62T	Exome	CDKAL1	CDK5 regulatory subunit associated protein 1-like 1	CCDS4
CGOV62T	Exome	DNAH6	dynein heavy chain 6, axonemal	NM_00
CGOV62T	Exome	DUSP27	dual specificity phosphatase 27 (putative)	CCDS3
CGOV62T	Exome	EPHA5	EPH receptor A5	CCDS3
CGOV62T	Exome	FAM5C	family with sequence similarity 5; member C	CCDS1
CGOV62T	Exome	KIF17	kinesin family member 17	CCDS2
CGOV62T	Exome	KIF3C	kinesin family member 3C	CCDS1
CGOV62T	Exome	PRSS23	protease; serine; 23	CCDS4
CGOV62T	Exome	RANBP2	RAN binding protein 2	CCDS2
CGOV62T	Exome	RHBDD1	rhomboid domain containing 1	CCDS2

CGOV62T	Exome	ROBO1	roundabout homolog 1 isoform a precursor	NM_001101001
		SEMA3F	sema domain; immunoglobulin domain (Ig); short basic domain; secreted; (semaphorin) 3F	CCDS2740.1
CGOV62T	Exome			
CGOV62T	Exome	SI	sucrase-isomaltase (alpha-glucosidase)	CCDS3250.1
		SLC1A2	solute carrier family 1 (glial high affinity glutamate transporter); member 2	CCDS3250.1
CGOV62T	Exome			
		SLC25A3	solute carrier family 25 (mitochondrial carrier; phosphate carrier); member 3	CCDS920.1
CGOV62T	Exome			
CGOV62T	Exome	TP53	tumor protein p53	CCDS110.1
		TRIO	triple functional domain (PTPRF interacting)	CCDS3250.1
CGOV62T	Exome			
CGOV62T	Exome	USP34	ubiquitin specific peptidase 34	CCDS420.1
		WDR11	WD repeat domain 11	CCDS720.1
CGOV62T	Exome			
CGOV62T	Exome	ZBBX	zinc finger; B-box domain containing	CCDS3250.1
		ZNF71	zinc finger protein 71	CCDS110.1
CGOV62T	Exome			
CGOV304T	Exome	ANKRD62	ankyrin repeat domain 62	NM_001101001
		ANXA1	annexin A1	CCDS620.1
CGOV304T	Exome			
CGOV304T	Exome	ARFGAP3	ADP-ribosylation factor GTPase activating protein 3	CCDS110.1
		ASPM	asp (abnormal spindle) homolog, microcephaly associated (Drosophila)	CCDS110.1
CGOV304T	Exome			
CGOV304T	Exome	ATF6	activating transcription factor 6	CCDS110.1
		BMP2K	BMP2 inducible kinase	CCDS420.1
CGOV304T	Exome			
CGOV304T	Exome	CDH26	cadherin 26	CCDS110.1
		CDK18	cyclin-dependent kinase 18	CCDS110.1
CGOV304T	Exome			
CGOV304T	Exome	COL17A1	collagen, type XVII, alpha 1	CCDS720.1
		DAPK1	death-associated protein kinase 1	CCDS420.1
CGOV304T	Exome			
CGOV304T	Exome	DDX47	DEAD (Asp-Glu-Ala-Asp) box polypeptide 47	CCDS820.1

CGOV304T	Exome	DOCK8	dedicator of cytokinesis 8	CCDS6
CGOV304T	Exome	DUSP27	dual specificity phosphatase 27 (putative)	CCDS3
CGOV304T	Exome	FA2H	fatty acid 2-hydroxylase	CCDS1
CGOV304T	Exome	FAM186B	family with sequence similarity 186, member B	CCDS8
CGOV304T	Exome	FCER2	Fc fragment of IgE, low affinity II, receptor for (CD23)	CCDS1
CGOV304T	Exome	FOLR1	folate receptor 1 (adult)	CCDS8
CGOV304T	Exome	GALNT3	UDP-N-acetyl-alpha-D-galactosamine:polypeptide N-acetylgalactosaminyltransferase 3 (GalNAc-T3)	CCDS2
CGOV304T	Exome	GLCE	glucuronic acid epimerase	CCDS3
CGOV304T	Exome	GP9	glycoprotein IX (platelet)	CCDS3
CGOV304T	Exome	HECW1	HECT, C2 and WW domain containing E3 ubiquitin protein ligase 1	CCDS5
CGOV304T	Exome	JMJD7-PLA2G4B	JMJD7-PLA2G4B readthrough	CCDS3
CGOV304T	Exome	KBTBD8	kelch repeat and BTB (POZ) domain containing 8	CCDS2
CGOV304T	Exome	KIAA1462	KIAA1462	CCDS4
CGOV304T	Exome	LRRC16B	leucine rich repeat containing 16B	CCDS3
CGOV304T	Exome	LRRFIP2	leucine rich repeat (in FLII) interacting protein 2	CCDS2
CGOV304T	Exome	LYNX1	Ly6/neurotoxin 1	CCDS3
CGOV304T	Exome	MAEA	macrophage erythroblast attacher	CCDS3
CGOV304T	Exome	MUC19	mucin 19, oligomeric	NM_17
CGOV304T	Exome	NPDC1	neural proliferation, differentiation and control, 1 pregnancy-associated	CCDS7
CGOV304T	Exome	PAPPA	plasma protein A, pappalysin 1	CCDS6
CGOV304T	Exome	PDE1C	phosphodiesterase 1C, calmodulin-dependent 70kDa	CCDS5
CGOV304T	Exome	PLCE1	phospholipase C, epsilon 1	CCDS4

CGOV304T	Exome	R3HDML	R3H domain containing-like	CCDS1
CGOV304T	Exome	SALL3	sal-like 3 (Drosophila)	CCDS1
CGOV304T	Exome	SCN2A	sodium channel, voltage-gated, type II, alpha subunit	CCDS3
CGOV304T	Exome	SPPL3	signal peptide peptidase like 3	CCDS9
CGOV304T	Exome	SULT1B1	sulfotransferase family, cytosolic, 1B, member 1	CCDS3
CGOV304T	Exome	TAF1L	TAF1 RNA polymerase II, TATA box binding protein (TBP)-associated factor, 210kDa-like	CCDS3
CGOV304T	Exome	TINF2	TERF1 (TRF1)-interacting nuclear factor 2	CCDS4
CGOV304T	Exome	TLR10	toll-like receptor 10	CCDS3
CGOV304T	Exome	TMEM215	transmembrane protein 215	CCDS6
CGOV304T	Exome	TP53	tumor protein p53	CCDS1
CGOV304T	Exome	ZMYM3	zinc finger, MYM-type 3	CCDS1
CGOV304T	Exome	ZNF292	zinc finger protein 292	CCDS4
CGOV304T	Exome	ZNF41	zinc finger protein 41	CCDS1
CGOV303T1	Exome	AGXT2	alanine--glyoxylate aminotransferase 2	CCDS3
CGOV303T1	Exome	BATF	basic leucine zipper transcription factor, ATF-like	CCDS9
CGOV303T1	Exome	CDH23	cadherin-related 23	NM_00
CGOV303T1	Exome	DMD	dystrophin	CCDS1
CGOV303T1	Exome	EMP3	epithelial membrane protein 3	CCDS1
CGOV303T1	Exome	IGSF9	immunoglobulin superfamily, member 9	CCDS4
CGOV303T1	Exome	KIF1A	kinesin family member 1A	CCDS5
CGOV303T1	Exome	KIF1A	kinesin family member 1A	CCDS5
CGOV303T1	Exome	NOTCH3	notch 3	CCDS1
CGOV303T1	Exome	OFD1	oral-facial-digital syndrome 1	CCDS1

CGOV303T1	Exome	PIK3CA	phosphatidylinositol-4,5-bisphosphate 3-kinase, catalytic subunit alpha	CCDS4
CGOV303T1	Exome	R3HDM1	R3H domain containing 1	CCDS2
CGOV303T1	Exome	RAP1GAP	RAP1 GTPase activating protein	CCDS5
CGOV303T1	Exome	RASL12	RAS-like, family 12	CCDS1
CGOV303T1	Exome	SLC38A10	solute carrier family 38, member 10	CCDS1
CGOV303T1	Exome	SLCO4C1	solute carrier organic anion transporter family, member 4C1	CCDS3
CGOV303T1	Exome	SOX6	SRY (sex determining region Y)-box 6	CCDS7
CGOV303T1	Exome	SPPL2C	signal peptide peptidase like 2C	CCDS3
CGOV303T1	Exome	TEP1	telomerase-associated protein 1	CCDS9
CGOV303T1	Exome	TM4SF20	transmembrane 4 L six family member 20	CCDS2
CGOV303T1	Exome	TP53	tumor protein p53	CCDS1
CGOV303T1	Exome	VAV3	vav 3 guanine nucleotide exchange factor	CCDS7
CGOV303T	Exome	ABCB6	ATP-binding cassette, sub-family B (MDR/TAP), member 6	CCDS2
CGOV303T	Exome	AGXT2	alanine--glyoxylate aminotransferase 2	CCDS3
CGOV303T	Exome	AGXT2	alanine--glyoxylate aminotransferase 2	CCDS3
CGOV303T	Exome	ASAP1	ArfGAP with SH3 domain, ankyrin repeat and PH domain 1	CCDS6
CGOV303T	Exome	BATF	basic leucine zipper transcription factor, ATF-like	CCDS9
CGOV303T	Exome	CDH23	cadherin-related 23	NM_00
CGOV303T	Exome	DMD	dystrophin	CCDS1
CGOV303T	Exome	GTPBP2	GTP binding protein 2	CCDS4
CGOV303T	Exome	HTR5A	5-hydroxytryptamine (serotonin) receptor 5A, G protein-coupled	CCDS5
CGOV303T	Exome	HUWE1	HECT, UBA and WWE domain containing 1, E3 ubiquitin protein ligase	CCDS3

CGOV303T	Exome	KIF1A	kinesin family member 1A	CCDS5
CGOV303T	Exome	KMT2C	lysine (K)-specific methyltransferase 2C	CCDS5
CGOV303T	Exome	NOTCH3	notch 3	CCDS1
CGOV303T	Exome	OR13A1	olfactory receptor, family 13, subfamily A, member 1	CCDS3
CGOV303T	Exome	PIK3CA	phosphatidylinositol-4,5-bisphosphate 3-kinase, catalytic subunit alpha	CCDS4
CGOV303T	Exome	PRRC2C	proline-rich coiled-coil 2C	CCDS1
CGOV303T	Exome	PYGM	phosphorylase, glycogen, muscle	CCDS8
CGOV303T	Exome	R3HDM1	R3H domain containing 1	CCDS2
CGOV303T	Exome	RAP1GAP	RAP1 GTPase activating protein	CCDS5
CGOV303T	Exome	RASL12	RAS-like, family 12	CCDS1
CGOV303T	Exome	SASS6	spindle assembly 6 homolog (C. elegans)	CCDS7
CGOV303T	Exome	SLCO4C1	solute carrier organic anion transporter family, member 4C1	CCDS3
CGOV303T	Exome	SOX6	SRY (sex determining region Y)-box 6	CCDS7
CGOV303T	Exome	SPPL2C	signal peptide peptidase like 2C	CCDS3
CGOV303T	Exome	SYNE1	spectrin repeat containing, nuclear envelope 1	CCDS5
CGOV303T	Exome	TCTE1	t-complex-associated-testis-expressed 1	CCDS4
CGOV303T	Exome	TEP1	telomerase-associated protein 1	CCDS9
CGOV303T	Exome	TM4SF20	transmembrane 4 L six family member 20	CCDS2
CGOV303T	Exome	TP53	tumor protein p53	CCDS1
CGOV303T	Exome	UHRF1	ubiquitin-like with PHD and ring finger domains 1	NM_01
CGOV303T	Exome	USP29	ubiquitin specific peptidase 29	CCDS3
CGOV303T	Exome	VAV3	vav 3 guanine nucleotide exchange factor	CCDS7
CGOV303T	Exome	ZMYND15	zinc finger, MYND-type containing 15	CCDS5
CGOV280T6	Exome	ADAMTSL4	ADAMTS-like 4	CCDS9

CGOV280T6	Exome	C1orf173	chromosome 1 open reading frame 173	CCDS3
CGOV280T6	Exome	FLG2	filaggrin family member 2	CCDS3
CGOV280T6	Exome	FOXG1	forkhead box G1	CCDS9
CGOV280T6	Exome	GPR25	G protein-coupled receptor 25	CCDS1
CGOV280T6	Exome	INPP5E		CCDS7
CGOV280T6	Exome	ISM1		CCDS4
CGOV280T6	Exome	LPIN3		CCDS3
CGOV280T6	Exome	LRP1		CCDS8
CGOV280T6	Exome	MRPS12	mitochondrial ribosomal protein S12	CCDS1
CGOV280T6	Exome	MS4A14		CCDS5
CGOV280T6	Exome	NALCN	sodium leak channel, non-selective	CCDS9
CGOV280T6	Exome	NOS1AP	nitric oxide synthase 1 (neuronal) adaptor protein	CCDS1
CGOV280T6	Exome	NPAP1	nuclear pore associated protein 1	CCDS1
CGOV280T6	Exome	REV3L	REV3-like, polymerase (DNA directed), zeta, catalytic subunit	CCDS5
CGOV280T6	Exome	RHBDL3	rhomboid, veinlet-like 3 (Drosophila)	CCDS3
CGOV280T6	Exome	SETBP1		CCDS4
CGOV280T6	Exome	SLX4	SLX4 structure-specific endonuclease subunit	CCDS1
CGOV280T6	Exome	XIRP2	xin actin-binding repeat containing 2	CCDS4
CGOV280T6	Exome	ZMYM6	zinc finger, MYM-type 6	CCDS3
CGOV280T5	Exome	ABCA13	ATP-binding cassette, sub-family A (ABC1), member 13	CCDS4
CGOV280T5	Exome	ADAMTSL4	ADAMTS-like 4	CCDS9
CGOV280T5	Exome	ASB15	ankyrin repeat and SOCS box containing 15	CCDS3
CGOV280T5	Exome	C1orf173	chromosome 1 open reading frame 173	CCDS3
CGOV280T5	Exome	CACNA1C	calcium channel, voltage-dependent, L type, alpha 1C subunit	CCDS4

CGOV280T5	Exome	CCR2	chemokine (C-C motif) receptor 2	CCDS4
CGOV280T5	Exome	CDC5L	cell division cycle 5-like	CCDS4
CGOV280T5	Exome	DNAH3	dynein, axonemal, heavy chain 3	CCDS1
CGOV280T5	Exome	DUSP27	dual specificity phosphatase 27 (putative)	CCDS3
CGOV280T5	Exome	FLG2	filaggrin family member 2	CCDS3
CGOV280T5	Exome	FOXP1	forkhead box G1	CCDS9
CGOV280T5	Exome	GPR158	G protein-coupled receptor 158	CCDS3
CGOV280T5	Exome	GPR25	G protein-coupled receptor 25	CCDS1
CGOV280T5	Exome	INPP5E		CCDS7
CGOV280T5	Exome	ISM1		CCDS4
CGOV280T5	Exome	LPIN3		CCDS3
CGOV280T5	Exome	LRP1		CCDS8
CGOV280T5	Exome	MRPS12	mitochondrial ribosomal protein S12	CCDS1
CGOV280T5	Exome	MS4A14		CCDS5
CGOV280T5	Exome	MTA3	metastasis associated 1 family, member 3	CCDS4
CGOV280T5	Exome	NALCN	sodium leak channel, non- selective	CCDS9
CGOV280T5	Exome	NOS1AP	nitric oxide synthase 1 (neuronal) adaptor protein	CCDS1
CGOV280T5	Exome	NPAP1	nuclear pore associated protein 1	CCDS1
CGOV280T5	Exome	PCDHGB4	protocadherin gamma subfamily B, 4	CCDS5
CGOV280T5	Exome	PDE2A	phosphodiesterase 2A, cGMP-stimulated	CCDS8
CGOV280T5	Exome	PPP1CC	protein phosphatase 1, catalytic subunit, gamma isozyme	CCDS5
CGOV280T5	Exome	PREX1	phosphatidylinositol-3,4,5- trisphosphate-dependent Rac exchange factor 1	CCDS1
CGOV280T5	Exome	REV3L	REV3-like, polymerase (DNA directed), zeta, catalytic subunit	CCDS5
CGOV280T5	Exome	RHBDL3	rhomboid, veinlet-like 3 (Drosophila)	CCDS3

CGOV280T5	Exome	SETBP1		CCDS4
CGOV280T5	Exome	SETD2	SET domain containing 2	CCDS2
CGOV280T5	Exome	SHPRH	SNF2 histone linker PHD RING helicase, E3 ubiquitin protein ligase	CCDS4
CGOV280T5	Exome	SLX4	SLX4 structure-specific endonuclease subunit	CCDS1
CGOV280T5	Exome	ST18	suppression of tumorigenicity 18 (breast carcinoma) (zinc finger protein)	CCDS6
CGOV280T5	Exome	TMEM64	transmembrane protein 64	CCDS3
CGOV280T5	Exome	TP53	tumor protein p53	CCDS1
CGOV280T5	Exome	TRHR	thyrotropin-releasing hormone receptor	CCDS6
CGOV280T5	Exome	TRIML1	tripartite motif family-like 1	CCDS3
CGOV280T5	Exome	TTN	titin	CCDS5
CGOV280T5	Exome	XIRP2	xin actin-binding repeat containing 2	CCDS4
CGOV280T5	Exome	ZMIZ2	zinc finger, MIZ-type containing 2	CCDS4
CGOV280T5	Exome	ZMYM6	zinc finger, MYM-type 6	CCDS3
CGOV280T4	Exome	ABCA13	ATP-binding cassette, sub- family A (ABC1), member 13	CCDS4
CGOV280T4	Exome	ADAMTSL 4	ADAMTS-like 4	CCDS9
CGOV280T4	Exome	ASB15	ankyrin repeat and SOCS box containing 15	CCDS3
CGOV280T4	Exome	C1orf173	chromosome 1 open reading frame 173	CCDS3
CGOV280T4	Exome	CACNA1C	calcium channel, voltage- dependent, L type, alpha 1C subunit	CCDS4
CGOV280T4	Exome	CCR2	chemokine (C-C motif) receptor 2	CCDS4
CGOV280T4	Exome	DNAH3	dynein, axonemal, heavy chain 3	CCDS1
CGOV280T4	Exome	DUSP27	dual specificity phosphatase 27 (putative)	CCDS3
CGOV280T4	Exome	EFCAB4B	EF-hand calcium binding domain 4B	CCDS4
CGOV280T4	Exome	FLG2	filaggrin family member 2	CCDS3

CGOV280T4	Exome	GPR158	G protein-coupled receptor 158	CCDS3
CGOV280T4	Exome	GPR25	G protein-coupled receptor 25	CCDS1
CGOV280T4	Exome	GRM7	glutamate receptor, metabotropic 7	CCDS4
CGOV280T4	Exome	INPP5E		CCDS7
CGOV280T4	Exome	ISM1		CCDS4
CGOV280T4	Exome	LPIN3		CCDS3
CGOV280T4	Exome	LRP1		CCDS8
CGOV280T4	Exome	MS4A14		CCDS5
CGOV280T4	Exome	MTA3	metastasis associated 1 family, member 3	CCDS4
CGOV280T4	Exome	NALCN	sodium leak channel, non-selective	CCDS9
CGOV280T4	Exome	PARN	poly(A)-specific ribonuclease	CCDS4
CGOV280T4	Exome	PCDHGB4	protocadherin gamma subfamily B, 4	CCDS5
CGOV280T4	Exome	PDE2A	phosphodiesterase 2A, cGMP-stimulated	CCDS8
CGOV280T4	Exome	PREX1	phosphatidylinositol-3,4,5-trisphosphate-dependent Rac exchange factor 1	CCDS1
CGOV280T4	Exome	SETBP1		CCDS4
CGOV280T4	Exome	SETD2	SET domain containing 2	CCDS2
CGOV280T4	Exome	SHPRH	SNF2 histone linker PHD RING helicase, E3 ubiquitin protein ligase	CCDS4
CGOV280T4	Exome	SLX4	SLX4 structure-specific endonuclease subunit	CCDS1
CGOV280T4	Exome	ST18	suppression of tumorigenicity 18 (breast carcinoma) (zinc finger protein)	CCDS6
CGOV280T4	Exome	STK36	serine/threonine kinase 36	CCDS2
CGOV280T4	Exome	TMEM64	transmembrane protein 64	CCDS3
CGOV280T4	Exome	TP53	tumor protein p53	CCDS1
CGOV280T4	Exome	TRHR	thyrotropin-releasing hormone receptor	CCDS6

CGOV280T4	Exome	TRIML1	tripartite motif family-like 1	CCDS3
CGOV280T4	Exome	TTN	titin	CCDS5
CGOV280T4	Exome	XIRP2	xin actin-binding repeat containing 2	CCDS4
CGOV280T4	Exome	ZFHX4	zinc finger homeobox 4	CCDS4
CGOV280T4	Exome	ZMIZ2	zinc finger, MIZ-type containing 2	CCDS4
CGOV280T4	Exome	ZMYM6	zinc finger, MYM-type 6	CCDS3
CGOV280T4	Exome	ZNF804B	zinc finger protein 804B	CCDS5
CGOV280T3	Exome	ABCA13	ATP-binding cassette, sub-family A (ABC1), member 13	CCDS4
CGOV280T3	Exome	ADAMTSL4	ADAMTS-like 4	CCDS9
CGOV280T3	Exome	ASB15	ankyrin repeat and SOCS box containing 15	CCDS3
CGOV280T3	Exome	C1orf173	chromosome 1 open reading frame 173	CCDS3
CGOV280T3	Exome	CACNA1C	calcium channel, voltage-dependent, L type, alpha 1C subunit	CCDS4
CGOV280T3	Exome	CCR2	chemokine (C-C motif) receptor 2	CCDS4
CGOV280T3	Exome	DNAH3	dynein, axonemal, heavy chain 3	CCDS1
CGOV280T3	Exome	DUSP27	dual specificity phosphatase 27 (putative)	CCDS3
CGOV280T3	Exome	FLG2	filaggrin family member 2	CCDS3
CGOV280T3	Exome	FOXG1	forkhead box G1	CCDS9
CGOV280T3	Exome	GPR158	G protein-coupled receptor 158	CCDS3
CGOV280T3	Exome	GPR25	G protein-coupled receptor 25	CCDS1
CGOV280T3	Exome	INPP5E		CCDS7
CGOV280T3	Exome	IQSEC1	IQ motif and Sec7 domain 1	CCDS3
CGOV280T3	Exome	ISM1		CCDS4
CGOV280T3	Exome	LPIN3		CCDS3
CGOV280T3	Exome	LRP1		CCDS8

CGOV280T3	Exome	MS4A14		CCDS5
CGOV280T3	Exome	MTA3	metastasis associated 1 family, member 3	CCDS4
CGOV280T3	Exome	NALCN	sodium leak channel, non-selective	CCDS9
CGOV280T3	Exome	NOS1AP	nitric oxide synthase 1 (neuronal) adaptor protein	CCDS1
CGOV280T3	Exome	NPAP1	nuclear pore associated protein 1	CCDS1
CGOV280T3	Exome	PCDHGB4	protocadherin gamma subfamily B, 4	CCDS5
CGOV280T3	Exome	PDE2A	phosphodiesterase 2A, cGMP-stimulated	CCDS8
CGOV280T3	Exome	POU3F2	POU class 3 homeobox 2	CCDS5
CGOV280T3	Exome	PREX1	phosphatidylinositol-3,4,5-trisphosphate-dependent Rac exchange factor 1	CCDS1
CGOV280T3	Exome	SETBP1		CCDS4
CGOV280T3	Exome	SHPRH	SNF2 histone linker PHD RING helicase, E3 ubiquitin protein ligase	CCDS4
CGOV280T3	Exome	SLX4	SLX4 structure-specific endonuclease subunit	CCDS1
CGOV280T3	Exome	ST18	suppression of tumorigenicity 18 (breast carcinoma) (zinc finger protein)	CCDS6
CGOV280T3	Exome	TMEM64	transmembrane protein 64	CCDS3
CGOV280T3	Exome	TP53	tumor protein p53	CCDS1
CGOV280T3	Exome	TRHR	thyrotropin-releasing hormone receptor	CCDS6
CGOV280T3	Exome	TRIML1	tripartite motif family-like 1	CCDS3
CGOV280T3	Exome	TTN	titin	CCDS5
CGOV280T3	Exome	XIRP2	xin actin-binding repeat containing 2	CCDS4
CGOV280T3	Exome	ZMIZ2	zinc finger, MIZ-type containing 2	CCDS4
CGOV280T3	Exome	ZMYM6	zinc finger, MYM-type 6	CCDS3
CGOV280T2	Exome	ABCA13	ATP-binding cassette, sub-family A (ABC1), member 13	CCDS4
CGOV280T2	Exome	ASB15	ankyrin repeat and SOCS box containing 15	CCDS3

CGOV280T2	Exome	C1orf173	chromosome 1 open reading frame 173	CCDS3
CGOV280T2	Exome	CACNA1C	calcium channel, voltage-dependent, L type, alpha 1C subunit	CCDS4
CGOV280T2	Exome	CACNB4	calcium channel, voltage-dependent, beta 4 subunit	CCDS4
CGOV280T2	Exome	CCR2	chemokine (C-C motif) receptor 2	CCDS4
CGOV280T2	Exome	DNAH3	dynein, axonemal, heavy chain 3	CCDS1
CGOV280T2	Exome	DNAH6	dynein, axonemal, heavy chain 6	CCDS4
CGOV280T2	Exome	DUSP27	dual specificity phosphatase 27 (putative)	CCDS3
CGOV280T2	Exome	EYA3	eyes absent homolog 3 (Drosophila)	CCDS3
CGOV280T2	Exome	FLG2	filaggrin family member 2	CCDS3
CGOV280T2	Exome	GALNT16	UDP-N-acetyl-alpha-D-galactosamine:polypeptide N-acetylgalactosaminyltransferase 16	CCDS3
CGOV280T2	Exome	GP6	glycoprotein VI (platelet)	CCDS4
CGOV280T2	Exome	GPR158	G protein-coupled receptor 158	CCDS3
CGOV280T2	Exome	GPR25	G protein-coupled receptor 25	CCDS1
CGOV280T2	Exome	GPRC5B	G protein-coupled receptor, family C, group 5, member B	CCDS1
CGOV280T2	Exome	INPP5E		CCDS7
CGOV280T2	Exome	ISM1		CCDS4
CGOV280T2	Exome	LPIN3		CCDS3
CGOV280T2	Exome	LRP1		CCDS8
CGOV280T2	Exome	MS4A14		CCDS5
CGOV280T2	Exome	MTA3	metastasis associated 1 family, member 3	CCDS4
CGOV280T2	Exome	PCDHGB4	protocadherin gamma subfamily B, 4	CCDS5
CGOV280T2	Exome	PDE2A	phosphodiesterase 2A, cGMP-stimulated	CCDS8
CGOV280T2	Exome	PER1	period circadian clock 1	CCDS1

CGOV280T2	Exome	PREX1	phosphatidylinositol-3,4,5-trisphosphate-dependent Rac exchange factor 1	CCDS1
CGOV280T2	Exome	SAMD4B	sterile alpha motif domain containing 4B	CCDS3
CGOV280T2	Exome	SETBP1		CCDS4
CGOV280T2	Exome	SETD2	SET domain containing 2	CCDS2
CGOV280T2	Exome	SHPRH	SNF2 histone linker PHD RING helicase, E3 ubiquitin protein ligase suppression of tumorigenicity 18 (breast carcinoma) (zinc finger protein)	CCDS4
CGOV280T2	Exome	ST18		CCDS6
CGOV280T2	Exome	STK36	serine/threonine kinase 36	CCDS2
CGOV280T2	Exome	TMEM64	transmembrane protein 64	CCDS3
CGOV280T2	Exome	TP53	tumor protein p53	CCDS1
CGOV280T2	Exome	TRHR	thyrotropin-releasing hormone receptor	CCDS6
CGOV280T2	Exome	TRIML1	tripartite motif family-like 1	CCDS3
CGOV280T2	Exome	TTN	titin	CCDS5
CGOV280T2	Exome	XIRP2	xin actin-binding repeat containing 2	CCDS4
CGOV280T2	Exome	ZKSCAN8	zinc finger with KRAB and SCAN domains 8	CCDS4
CGOV280T2	Exome	ZMIZ2	zinc finger, MIZ-type containing 2	CCDS4
CGOV280T2	Exome	ZMYM6	zinc finger, MYM-type 6	CCDS3
CGOV280T6	Exome	ABCA13	ATP-binding cassette, sub-family A (ABC1), member 13	CCDS4
CGOV280T6	Exome	ASB15	ankyrin repeat and SOCS box containing 15	CCDS3
CGOV280T6	Exome	CACNA1C	calcium channel, voltage-dependent, L type, alpha 1C subunit	CCDS4
CGOV280T6	Exome	CCR2	chemokine (C-C motif) receptor 2	CCDS4
CGOV280T6	Exome	DNAH3	dynein, axonemal, heavy chain 3	CCDS1
CGOV280T6	Exome	DUSP27	dual specificity phosphatase 27 (putative)	CCDS3

CGOV280T6	Exome	GPR158	G protein-coupled receptor 158	CCDS3
CGOV280T6	Exome	MTA3	metastasis associated 1 family, member 3	CCDS4
CGOV280T6	Exome	PCDHGB4	protocadherin gamma subfamily B, 4	CCDS5
CGOV280T6	Exome	PDE2A	phosphodiesterase 2A, cGMP-stimulated	CCDS8
CGOV280T6	Exome	PREX1	phosphatidylinositol-3,4,5-trisphosphate-dependent Rac exchange factor 1	CCDS1
CGOV280T6	Exome	TMEM64	transmembrane protein 64	CCDS3
CGOV280T6	Exome	TP53	tumor protein p53	CCDS1
CGOV280T6	Exome	TRHR	thyrotropin-releasing hormone receptor	CCDS6
CGOV280T6	Exome	TRIML1	tripartite motif family-like 1	CCDS3
CGOV280T6	Exome	TTN	titin	CCDS5
CGOV280T6	Exome	ZMIZ2	zinc finger, MIZ-type containing 2	CCDS4
CGOV279T4	Exome	ARAP3	ArfGAP with RhoGAP domain, ankyrin repeat and PH domain 3	CCDS4
CGOV279T4	Exome	ATN1	atrophin 1	CCDS3
CGOV279T4	Exome	ATP13A3	ATPase type 13A3	CCDS4
CGOV279T4	Exome	C20orf194	chromosome 20 open reading frame 194	CCDS4
CGOV279T4	Exome	CD14	CD14 molecule	CCDS4
CGOV279T4	Exome	DLG5	discs, large homolog 5 (Drosophila)	CCDS7
CGOV279T4	Exome	EVC2	Ellis van Creveld syndrome 2	CCDS3
CGOV279T4	Exome	IGSF21	immunoglobulin superfamily, member 21	CCDS1
CGOV279T4	Exome	KCNJ10	potassium inwardly-rectifying channel, subfamily J, member 10	CCDS1
CGOV279T4	Exome	KCNQ2	potassium voltage-gated channel, KQT-like subfamily, member 2	CCDS1
CGOV279T4	Exome	KIAA1614	KIAA1614	CCDS4
CGOV279T4	Exome	LAMA5	laminin, alpha 5	CCDS3

CGOV279T4	Exome	MB	myoglobin	CCDS1
CGOV279T4	Exome	MCL1	myeloid cell leukemia sequence 1 (BCL2-related)	CCDS9
CGOV279T4	Exome	NOL4	nucleolar protein 4	CCDS1
CGOV279T4	Exome	OR8S1	olfactory receptor, family 8, subfamily S, member 1	CCDS3
CGOV279T4	Exome	SLC13A3	solute carrier family 13 (sodium-dependent dicarboxylate transporter), member 3	CCDS1
CGOV279T4	Exome	SLC41A3	solute carrier family 41, member 3	CCDS3
CGOV279T4	Exome	SP9	Sp9 transcription factor	CCDS4
CGOV279T4	Exome	SV2C	synaptic vesicle glycoprotein 2C	CCDS4
CGOV279T4	Exome	TP53	tumor protein p53	CCDS1
CGOV279T4	Exome	TRPC7	transient receptor potential cation channel, subfamily C, member 7	CCDS4
CGOV279T4	Exome	VPS16	vacuolar protein sorting 16 homolog (S. cerevisiae)	CCDS1
CGOV279T3	Exome	ATN1	atrophin 1	CCDS3
CGOV279T3	Exome	ATP13A3	ATPase type 13A3	CCDS4
CGOV279T3	Exome	CD14	CD14 molecule	CCDS4
CGOV279T3	Exome	GRIN2B	glutamate receptor, ionotropic, N-methyl D- aspartate 2B	CCDS8
CGOV279T3	Exome	IGSF21	immunoglobulin superfamily, member 21	CCDS1
CGOV279T3	Exome	KCNJ10	potassium inwardly- rectifying channel, subfamily J, member 10	CCDS1
CGOV279T3	Exome	KIAA1614	KIAA1614	CCDS4
CGOV279T3	Exome	NOL4	nucleolar protein 4	CCDS1
CGOV279T3	Exome	OR10W1	olfactory receptor, family 10, subfamily W, member 1	CCDS7
CGOV279T3	Exome	OR8S1	olfactory receptor, family 8, subfamily S, member 1	CCDS3
CGOV279T3	Exome	SLC13A3	solute carrier family 13 (sodium-dependent dicarboxylate transporter), member 3	CCDS1

CGOV279T3	Exome	SLC41A3	solute carrier family 41, member 3	CCDS3
CGOV279T3	Exome	SV2C	synaptic vesicle glycoprotein 2C	CCDS4
CGOV279T3	Exome	TP53	tumor protein p53	CCDS1
CGOV279T3	Exome	TRPC7	transient receptor potential cation channel, subfamily C, member 7	CCDS4
CGOV279T2	Exome	ATN1	atrophin 1	CCDS3
CGOV279T2	Exome	ATP13A3	ATPase type 13A3	CCDS4
CGOV279T2	Exome	CD14	CD14 molecule	CCDS4
CGOV279T2	Exome	GRIN2B	glutamate receptor, ionotropic, N-methyl D- aspartate 2B	CCDS8
CGOV279T2	Exome	IGSF21	immunoglobulin superfamily, member 21	CCDS1
CGOV279T2	Exome	KCNJ10	potassium inwardly- rectifying channel, subfamily J, member 10	CCDS1
CGOV279T2	Exome	KIAA1614	KIAA1614	CCDS4
CGOV279T2	Exome	NOL4	nucleolar protein 4	CCDS1
CGOV279T2	Exome	OR10W1	olfactory receptor, family 10, subfamily W, member 1	CCDS7
CGOV279T2	Exome	OR8S1	olfactory receptor, family 8, subfamily S, member 1	CCDS3
CGOV279T2	Exome	SLC13A3	solute carrier family 13 (sodium-dependent dicarboxylate transporter), member 3	CCDS1
CGOV279T2	Exome	SLC41A3	solute carrier family 41, member 3	CCDS3
CGOV279T2	Exome	TP53	tumor protein p53	CCDS1
CGOV279T2	Exome	TRPC7	transient receptor potential cation channel, subfamily C, member 7	CCDS4
CGOV279T1	Exome	ATN1	atrophin 1	CCDS3
CGOV279T1	Exome	ATP13A3	ATPase type 13A3	CCDS4
CGOV279T1	Exome	CD14	CD14 molecule	CCDS4
CGOV279T1	Exome	GRIN2B	glutamate receptor, ionotropic, N-methyl D- aspartate 2B	CCDS8

CGOV279T1	Exome	IGSF21	immunoglobulin superfamily, member 21	CCDS1
CGOV279T1	Exome	KCNJ10	potassium inwardly-rectifying channel, subfamily J, member 10	CCDS1
CGOV279T1	Exome	KIAA1614	KIAA1614	CCDS4
CGOV279T1	Exome	NOL4	nucleolar protein 4	CCDS1
CGOV279T1	Exome	OR10W1	olfactory receptor, family 10, subfamily W, member 1	CCDS7
CGOV279T1	Exome	OR8S1	olfactory receptor, family 8, subfamily S, member 1	CCDS3
CGOV279T1	Exome	SLC13A3	solute carrier family 13 (sodium-dependent dicarboxylate transporter), member 3	CCDS1
CGOV279T1	Exome	SLC41A3	solute carrier family 41, member 3	CCDS3
CGOV279T1	Exome	SV2C	synaptic vesicle glycoprotein 2C	CCDS4
CGOV279T1	Exome	TP53	tumor protein p53	CCDS1
CGOV279T1	Exome	TRPC7	transient receptor potential cation channel, subfamily C, member 7	CCDS4
CGOV278T4	Exome	ACTL10	actin-like 10	CCDS3
CGOV278T4	Exome	AHDC1	AT hook, DNA binding motif, containing 1	CCDS3
CGOV278T4	Exome	BAHCC1	BAH domain and coiled-coil containing 1	NM_00
CGOV278T4	Exome	COL6A5	collagen, type VI, alpha 5	NM_00
CGOV278T4	Exome	CREB3L1	cAMP responsive element binding protein 3-like 1	CCDS5
CGOV278T4	Exome	CTNND2	catenin (cadherin-associated protein), delta 2	CCDS3
CGOV278T4	Exome	ELL		CCDS1
CGOV278T4	Exome	EPPIN-WFDC6		CCDS5
CGOV278T4	Exome	GPATCH1	G patch domain containing 1	CCDS1
CGOV278T4	Exome	HKDC1	hexokinase domain containing 1	CCDS7
CGOV278T4	Exome	IGHMBP2	immunoglobulin mu binding protein 2	CCDS8
CGOV278T4	Exome	KCNAB1	potassium voltage-gated channel, shaker-related subfamily, beta member 1	CCDS3

CGOV278T4	Exome	KRT3	keratin 3	CCDS4
CGOV278T4	Exome	LCK	lymphocyte-specific protein tyrosine kinase	CCDS3
CGOV278T4	Exome	LMAN2	lectin, mannose-binding 2	CCDS4
CGOV278T4	Exome	MACF1	microtubule-actin crosslinking factor 1	CCDS4
CGOV278T4	Exome	MAGEC1	melanoma antigen family C, 1	CCDS3
CGOV278T4	Exome	METAP2	methionyl aminopeptidase 2	CCDS9
CGOV278T4	Exome	MPZ	myelin protein zero	CCDS1
CGOV278T4	Exome	NLRP5	NLR family, pyrin domain containing 5	CCDS1
CGOV278T4	Exome	NPFFR1		CCDS5
CGOV278T4	Exome	PTPRN	protein tyrosine phosphatase, receptor type, N	CCDS2
CGOV278T4	Exome	RAD9A		CCDS8
CGOV278T4	Exome	RNF148	ring finger protein 148	CCDS4
CGOV278T4	Exome	SERINC2	serine incorporator 2	CCDS5
CGOV278T4	Exome	SETD1A	SET domain containing 1A	CCDS3
CGOV278T4	Exome	SH3PXD2B	SH3 and PX domains 2B	CCDS3
CGOV278T4	Exome	SMARCA4		CCDS1
CGOV278T4	Exome	SYT12		CCDS8
CGOV278T4	Exome	SZT2	seizure threshold 2 homolog (mouse)	CCDS3
CGOV278T4	Exome	TMPPE	transmembrane protein with metallophosphoesterase domain	CCDS3
CGOV278T4	Exome	TP53	tumor protein p53	CCDS1
CGOV278T2	Exome	ABCG8	ATP-binding cassette, sub-family G (WHITE), member 8	CCDS1
CGOV278T2	Exome	ACTL10	actin-like 10	CCDS3
CGOV278T2	Exome	AHDC1	AT hook, DNA binding motif, containing 1	CCDS3
CGOV278T2	Exome	BAHCC1	BAH domain and coiled-coil containing 1	NM_00

CGOV278T2	Exome	COL6A5	collagen, type VI, alpha 5	NM_00
CGOV278T2	Exome	CREB3L1	cAMP responsive element binding protein 3-like 1	CCDS5
CGOV278T2	Exome	CTNND2	catenin (cadherin-associated protein), delta 2	CCDS3
CGOV278T2	Exome	ELL		CCDS1
CGOV278T2	Exome	EPPIN-WFDC6		CCDS5
CGOV278T2	Exome	GPATCH1	G patch domain containing 1	CCDS1
CGOV278T2	Exome	HKDC1	hexokinase domain containing 1	CCDS7
CGOV278T2	Exome	IGHMBP2	immunoglobulin mu binding protein 2	CCDS8
CGOV278T2	Exome	KCNAB1	potassium voltage-gated channel, shaker-related subfamily, beta member 1	CCDS3
CGOV278T2	Exome	KRT3	keratin 3	CCDS4
CGOV278T2	Exome	LCK	lymphocyte-specific protein tyrosine kinase	CCDS3
CGOV278T2	Exome	LMAN2	lectin, mannose-binding 2	CCDS4
CGOV278T2	Exome	MACF1	microtubule-actin crosslinking factor 1	CCDS4
CGOV278T2	Exome	MAGEC1	melanoma antigen family C, 1	CCDS3
CGOV278T2	Exome	METAP2	methionyl aminopeptidase 2	CCDS9
CGOV278T2	Exome	MPZ	myelin protein zero	CCDS1
CGOV278T2	Exome	NLRP5	NLR family, pyrin domain containing 5	CCDS1
CGOV278T2	Exome	NPFFR1		CCDS5
CGOV278T2	Exome	PCK2		CCDS9
CGOV278T2	Exome	PTPRN	protein tyrosine phosphatase, receptor type, N	CCDS2
CGOV278T2	Exome	RAD9A		CCDS8
CGOV278T2	Exome	RNF148	ring finger protein 148	CCDS4
CGOV278T2	Exome	SERINC2	serine incorporator 2	CCDS5
CGOV278T2	Exome	SETD1A	SET domain containing 1A	CCDS3

CGOV278T2	Exome	SH3PXD2B	SH3 and PX domains 2B	CCDS3
CGOV278T2	Exome	SMARCA4		CCDS1
CGOV278T2	Exome	SYT12		CCDS8
CGOV278T2	Exome	TMPPE	transmembrane protein with metallophosphoesterase domain	CCDS3
CGOV278T2	Exome	TP53	tumor protein p53	CCDS1
CGOV278T1	Exome	AHDC1	AT hook, DNA binding motif, containing 1	CCDS3
CGOV278T1	Exome	BAHCC1	BAH domain and coiled-coil containing 1	NM_00
CGOV278T1	Exome	COL6A5	collagen, type VI, alpha 5	NM_00
CGOV278T1	Exome	CREB3L1	cAMP responsive element binding protein 3-like 1	CCDS5
CGOV278T1	Exome	CTNND2	catenin (cadherin-associated protein), delta 2	CCDS3
CGOV278T1	Exome	ELL		CCDS1
CGOV278T1	Exome	EPPIN-WFDC6		CCDS5
CGOV278T1	Exome	GPATCH1	G patch domain containing 1	CCDS1
CGOV278T1	Exome	IGHMBP2	immunoglobulin mu binding protein 2	CCDS8
CGOV278T1	Exome	KCNAB1	potassium voltage-gated channel, shaker-related subfamily, beta member 1	CCDS3
CGOV278T1	Exome	KRT3	keratin 3	CCDS4
CGOV278T1	Exome	LMAN2	lectin, mannose-binding 2	CCDS4
CGOV278T1	Exome	MACF1	microtubule-actin crosslinking factor 1	CCDS4
CGOV278T1	Exome	METAP2	methionyl aminopeptidase 2	CCDS9
CGOV278T1	Exome	MPZ	myelin protein zero	CCDS1
CGOV278T1	Exome	NLRP5	NLR family, pyrin domain containing 5	CCDS1
CGOV278T1	Exome	PTPRN	protein tyrosine phosphatase, receptor type, N	CCDS2
CGOV278T1	Exome	RAD9A		CCDS8
CGOV278T1	Exome	SERINC2	serine incorporator 2	CCDS5

CGOV278T1	Exome	SMARCA4		CCDS1
CGOV278T1	Exome	TMPPE	transmembrane protein with metallophosphoesterase domain	CCDS3
CGOV278T1	Exome	TP53	tumor protein p53	CCDS1

---

### Supplementary Data 2.6. Recurrent Somatic Sequence Alterations

Case ID	Gene Symbol	Name
CGOV65	ABCA13	ATP-binding cassette; sub-family A (ABC1); member 13
CGOV280	ABCA13	ATP-binding cassette, sub-family A (ABC1), member 13
CGOV64	CWC22	CWC22 spliceosome-associated protein homolog (S. cerevisiae)
CGOV63	CWC22	CWC22 spliceosome-associated protein homolog (S. cerevisiae)
CGOV63	DNAH3	dynein; axonemal; heavy chain 3
CGOV280	DNAH3	dynein, axonemal, heavy chain 3
CGOV64	DUSP27	dual specificity phosphatase 27 (putative)
CGOV62	DUSP27	dual specificity phosphatase 27 (putative)
CGOV280	DUSP27	dual specificity phosphatase 27 (putative)
CGOV65	KIF13A	kinesin-like protein KIF13A isoform a
CGOV63	KIF13A	kinesin-like protein KIF13A isoform a
CGOV65	PIK3R5	phosphoinositide-3-kinase; regulatory subunit 5
CGOV64	PIK3R5	phosphoinositide-3-kinase; regulatory subunit 5
CGOV65	TP53	tumor protein p53
CGOV64	TP53	tumor protein p53
CGOV62	TP53	tumor protein p53
CGOV63	TP53	tumor protein p53
CGOV279	TP53	tumor protein p53
CGOV278	TP53	tumor protein p53
CGOV280	TP53	tumor protein p53
CGOV303	TP53	tumor protein p53
CGOV304	TP53	tumor protein p53
CGOV64	TTN	titin
CGOV63	TTN	titin

CGOV280	TTN	titin
CGOV65	WDFY4	WD repeat- and FYVE domain-containing protein 4
CGOV64	WDFY4	WD repeat- and FYVE domain-containing protein 4
CGOV62	WDR11	WD repeat domain 11
CGOV64	WDR11	WD repeat domain 11

---

## CHAPTER 3:

# INTEGRATED GENOMIC, EPIGENOMIC, AND EXPRESSION ANALYSES OF OVARIAN CANCER CELL LINES

## METHODS

### Cell Lines and Growth Analyses

All samples were obtained under Institutional Review Board–approved protocols with informed consent for research use or were publicly available. Cells were plated into 24-well tissue culture plates at a density of  $2 \times 10^5$  to  $5 \times 10^5$  cells per well and grown in cell line-specific medium without or with increasing concentrations of their respective drugs (ranging between 0.001 and 10  $\mu\text{M}$ /L). Cells were counted on day 7 using an automated cell viability assay (Vi-CELL XR Cell Viability Analyzer; Beckman Coulter, Fullerton, CA), a video imaging system that uses an automated trypan blue exclusion protocol. Both adherent and floating viable cells were counted for treatment and control wells. Growth inhibition (GI) was calculated as a percentage of untreated controls. The log of the fractional GI was then plotted against the log of the drug concentration and the IC<sub>50</sub> values were interpolated from the resulting linear regression curve fit (CalcuSyn; Biosoft, Ferguson, MO). Experiments were performed thrice in duplicate for each cell line.

### STR Analyses

Genomic DNA from all cell lines was PCR amplified using a Geneprint 10 System (Promega, Madison, WI) that contains eight STR loci plus Amelogenin, a gender-determining marker. The PCR amplification was carried out in a GeneAmp PCR System 9700 following the manufacturer's protocol. The PCR products were electrophoresed on a ABI Prism 3730xl Genetic Analyzer using Internal Lane Standard 600 (Promega) for sizing. Data were analyzed using GeneMapper v. 4.0 software (Applied Biosystems, Foster City, CA). We compared our STR profiles (Johns Hopkins University [JHU]) for these cell lines to external STR profiles, including Korch et al<sup>59</sup>, COSMIC (v83; <https://cancer.sanger.ac.uk/cosmic>), the RIKEN BioResource Center

(<https://www.jove.com/institutions/AS-asia/JP-japan/20278-riken-bioresource-center>), or Yu et al.<sup>60</sup> The average percent similarity between JHU STRs and external STRs was 98%. An external STR was not available for five cell lines.

### **Whole-Genome Next-Generation Sequencing**

DNA was extracted from cell lines using a QIAamp DNA Blood Mini QIAcube Kit (QIAGEN, Valencia, CA). In brief, the samples were incubated in proteinase K for 16 hr before DNA extraction. DNA purification was performed using the QIAamp DNA Blood Mini QIAcube kit following the manufacturer's instructions (QIAGEN, Valencia, CA). Genomic DNA from tumor samples were used for Illumina TruSeq library construction (Illumina, San Diego, CA) according to the manufacturer's instructions. Paired-end sequencing resulting in 100 bases from each end of the fragments was performed using Illumina HiSeq2000 instrumentation.

### **PCR and Sanger Sequencing**

PCR and Sanger sequencing confirmed the presence of fusion candidates generated by Trellis. Primers were designed 200 bp on either side of the junction. Primers were purchased from IDT (Coralville, IA) and purified by desalting. Primers and probes were resuspended to 100  $\mu$ M in IDTE (10 mM Tris, pH 8.0; 0.1 mM EDTA) buffer and stored at  $-20^{\circ}\text{C}$ . Using the primers specific for each fusion, PCR amplification was performed in a 50- $\mu$ L reaction volume in quadruplicate, consisting of 10  $\mu$ L of 5X Phusion buffer, 1  $\mu$ L of 10 mM dNTP, 2.5  $\mu$ L of each primer at 10  $\mu$ M, 0.5  $\mu$ L of HotStart Phusion, and 10 ng of cell line DNA. PCR was performed using a Bio-Rad S1000 Thermal Cycler. The thermal cycle was programmed for 30 s at  $98^{\circ}\text{C}$  for initial denaturation, followed by 34 cycles of 10 s at  $98^{\circ}\text{C}$  for denaturation, 30 s at  $59^{\circ}\text{C}$  for annealing, 30 s at  $72^{\circ}\text{C}$  for extension, and 5 min at  $72^{\circ}\text{C}$  for final extension. Human mixed

genomic DNA (Promega, Madison, WI) and no template were used as negative controls. PCR products were purified using Nucleospin Gel and PCR cleanup as per the manufacturer's instructions (Macherey-Nagel, Duren, Germany). PCR products were then subjected to Sanger sequencing using the Applied Biosystems 3730xl DNA Analyzer as per manufacturer's instructions (Thermo Fisher, Waltham, MA). Output was compared to original candidate fusion sequence and confirmed.

### **Droplet Digital PCR**

The translocation primers were designed on both sides of the translocation. One of these primers was used as a common primer for both the translocation and the control. A third primer was designed to be used in combination with the common primer to amplify the wild-type sequence of one of the two translocation partners. The hydrolysis probes labeled with the FAM-fluorochrome at the 5' end were designed to bind specifically to the translocation PCR product, while the probes labeled with the HEX-fluorochrome were designed to bind specifically to the control PCR product. As quenchers, a ZEN quencher was used as an internal quencher, while the Iowa Black FQ-quencher was added to the 3' end of the probes. Probes were designed to have a higher melting temperature than the primers. The primers and hydrolysis probes were purchased from IDT (Coralville, IA). The primers were purified by desalting, while the hydrolysis probes were purified using high-performance liquid chromatography. Upon arrival, primers and probes were resuspended to 100  $\mu$ M in IDTE (10 mM Tris, pH 8.0; 0.1 mM EDTA) buffer and stored at  $-20^{\circ}\text{C}$ . 20- $\mu$ L droplet digital PCR (ddPCR) reactions were prepared, using 10  $\mu$ L of 2 $\times$  ddPCR SuperMix for Probes (No dUTP) (Bio-Rad, Hercules, CA), 5–30 ng of gDNA, as quantified by the Qubit dsDNA high-sensitivity assay kit (Thermo Fisher Scientific, Waltham, MA), primers (each at a final concentration of 900 nM), probes (each at a final concentration of 250 nM), and nuclease-free water. Human mixed genomic DNA (Promega) was used as negative control. Droplets were

generated using the QX200 droplet generator (Bio-Rad) by loading the DG8 cartridge (Bio-Rad) with 20µL of the reaction mixture and 70µL of droplet generation oil for probes (Bio-Rad). 40µL of droplet/oil mixture was transferred to a ddPCR 96-well plate (Bio-Rad). The plate was heat-sealed with a pierceable foil heat seal (Bio-Rad). A S1000 Thermal Cycler (Bio-Rad) was used with the following amplification protocol: enzyme activation at 95°C for 10 min, followed by six cycles: denaturation at 54°C for 30 s; annealing/extension at 60°C for 1 min, followed by 34 cycles: denaturation at 58°C for 30 s; and annealing/extension at 60°C for 1 min. Following cycling, the samples were held at 98°C for 10 min. Upon completion of the PCR protocol, the plate was read using the QX200 droplet reader (Bio-Rad). Droplet counts and amplitudes were analyzed with QuantaSoft software (v1.7) (Bio-Rad).

### **Alignment and Identification of Sequence Alterations**

Prior to mutation calling, primary processing of sequence data for samples was performed using Illumina CASAVA software (v1.8.2), including masking of adaptor sequences. Sequence reads were aligned against the hg19 human reference genome using ELAND. Candidate somatic mutations in the exome, consisting of point mutations, insertions, and deletions were identified using VariantDx<sup>30</sup>. To detect mutations that were more likely to be somatic, we excluded mutations that appeared in >10% of the distinct reads and mutations tagged as COMMON or MULT in dbSNP VCF files. Additionally, we excluded mutations without a record in COSMIC as well as in-frame deletions (COSMIC v72). Exceptions to the COSMIC requirement were mutations that predicted truncations in relevant pathways or tumor suppressor genes (Table S3.1e). SNPs flagged as clinically associated or reported in COSMIC were not excluded regardless of heterozygosity or percentage of distinct reads. All candidate somatic mutations were confirmed by visual inspection. Samples with more than 2,000 alterations after dbSNP filtering were considered hypermutators. Mutational signatures were based on the fraction

of mutations in each of the 96 trinucleotide contexts<sup>61</sup>. The contribution of each signature to each tumor sample was estimated using the deconstructSigs R package (Table S3.1n for R package versions).

### **Implementation of DELLY and LUMPY**

Identifying probable somatic structural variants in tumor-only experimental designs is a major challenge. False positives arise from germline variants incorrectly reported as somatic and spurious alignments misinterpreted as biological variation. We considered two established tools, DELLY and LUMPY, for detection of structural variants<sup>62,63</sup>. Reads were aligned to the hg19 reference genome using BWA-MEM (version 0.7.10)<sup>64</sup> as recommended by these methods. DELLY (version 0.7.7) and LUMPY (version 0.2.13) were implemented using default parameters.

A simple leave-one-out cross-validation experiment was implemented using 10 lymphoblastoid controls to evaluate the specificity of these methods for identifying somatic structural variants in a tumor-only experimental design. Specifically, we treated the held out sample as a *tumor* and identified germline structural alterations in the training set. Excluding structural variants identified in the training set, we considered any alteration identified in the held-out sample as a false positive.

### **Implementation of Trellis**

#### **Germline Filters**

Using 10 lymphoblastoid cell lines and 8 normal ovarian samples, we developed sequence and germline filters for the hg19 reference genome to flag regions prone to alignment artifacts and/or germline structural variation. Sequence filters for the hg19 reference genome that were masked prior to copy number analyses comprised 326.4 Mb of the genome and included non-overlapping

1-kb genomic intervals (bins) with average mappability less than 0.75 or GC percentage less than 10%, as well as the gaps track from the University of California, Santa Cruz (UCSC) genome browser that includes heterochromatin, centromeric, and subtelomeric regions<sup>65</sup>. After removing these sequence filters as well as chrY (all cell lines were derived from women), we normalized the read depth for the remaining 2,680,222 bins. For each bin, we computed the GC-adjusted, log2-transformed count of aligned reads. GC normalization was implemented using a loess smoother with span 1/3 fitted to a scatterplot of the bin-level GC and log2 count. We denote the GC-adjusted log2 ratios (the residuals from the loess correction) by  $R$ , the mean  $R$  for a genomic region by  $\bar{R}$ , and the median absolute deviation of the autosomal  $R$ s by  $S$ . Because some bins had an unusually high or low number of aligned reads in multiple controls, we defined bin  $i$  in normal control  $j$  as an outlier if  $|R_i| > (3 \times S_j)$ . Bins identified as an outlier in two or more normal controls were flagged. These analyses flagged 55,764 genomic regions totaling 75.9 Mb of sequence. To identify somatic copy number alterations, we segmented the  $R$ s using circular binary segmentation implemented in the R package DNACopy with settings  $\alpha = 0.001$ ,  $\text{undo.splits} = \text{'sdundo'}$ , and  $\text{undo.SD} = 2^{66,67}$ . To exclude regions that were either copy number altered in the lymphoblastoid cell lines as well as segments that span difficult regions to genotype, we flagged segments having  $|\bar{R}| > 1$ . We flagged a total of 919 segments (46.8 Mb) across the 18 normal controls.

To characterize copy neutral rearrangements including inversions and translocations in the normal controls, we extracted all read pairs from the BAM file that were *improperly* paired and for which the intra-mate distance between paired reads was at least 10 kb. We defined a cluster of improper read pairs as a genomic region where at least one base is spanned by five or more improper reads and for which the union of the aligned regions is at least 115 bp. Next, we linked these clusters by the mates of the constituent reads. Clusters that could not be linked by at least five read pairs were excluded from further analysis. For all linked clusters, we required at least 90% of the linking read

pairs to support the same structural variant group (Table S3.11). Linked clusters for which the type of rearrangement was not consistent among the linking read pairs were excluded from further analysis. For the remaining linked clusters, we realigned all the reads supporting the link using the local aligner BLAT (Kent, 2002). A command-line version of BLAT was utilized for this step (Standalone BLAT v. 35). Confirmation by BLAT required that the reads only align to one location with a BLAT score  $\geq 90\%$  in the hg19 reference genome. These germline rearrangements were used to screen candidate somatic rearrangements as described in greater detail below.

### Somatic Deletions

Putative focal homozygous and hemizygous deletions greater than 2 kb and less than 3 Mb in the ovarian cell lines were identified by  $R^- < -3$  and  $R^- \in (-3, -0.75]$ , respectively. We excluded focal deletions in tumor samples if  $\geq 75\%$  of the region was identified as a deletion in a control sample. For each deletion, we investigated whether any improperly paired reads were aligned within 5 kb of the segmentation boundaries. When five or more rearranged read pairs were aligned near the segmentation boundaries, the distribution of the improper read pair alignments was used to further resolve the genomic coordinates of the deletion boundaries. Resolution of the deletion breakpoints using this approach depends on the intra-mate distance of the improperly paired reads. On average, the intra-mate distance in the ovarian tumors was 262 bp (5th and 95th percentiles, 183 and 353). With multiple rearranged read pairs, we expect that the resolution of the deletion breakpoints was generally less than 100 bp. As previously described, realignment by BLAT was used to confirm that the rearranged read pairs supporting the deletion mapped uniquely and with high fidelity to this region of the genome. Hemizygous and homozygous deletions supported by rearranged read pairs were indicated by hemizygous+ or homozygous+, respectively. Any deletion for which the outlier bins or germline CNVs occupied 75% or more of the width were excluded. Hemizygous deletions not supported by rearranged read pairs were also excluded. All deletions were confirmed by visual inspection.

### Somatic Amplifications

To identify focal amplicons and establish how these amplicons were linked in the tumor genome, we seeded a graph with high-copy focal amplicons. Specifically, putative amplifications were identified as segments with  $R^- > 1.46$ , or a 2.75-fold increase from the mean ploidy of the cell line, and between 2 kb and 3 Mb in length. Properly paired reads were used to link seed amplicons to adjacent low-copy duplications (segments with  $R^- > 0.81$  or fold change of 1.75). When five or more links were established, the low-copy segments were added as nodes to the graph with an edge indicating the connection between the high- and low-copy amplicons. Similarly, we established links between the low- and high-copy amplicons that were non-adjacent with respect to the reference genome by analysis of improperly paired reads as previously described.

### Somatic Copy-Neutral Intra- and Inter-chromosomal Translocations and Inversions

Candidate somatic copy-neutral rearrangements were identified as previously described in the control samples. However, rearrangements in the ovarian tumor cell lines that overlapped any rearrangement identified in the controls samples were excluded. In addition to improperly paired reads, we required at least one split read supporting the rearrangement. To identify split read alignments, we extracted all read pairs for which only one read in the pair was aligned within 5 kb of the candidate rearrangement. For all such read pairs, we re-aligned the unmapped mate using BLAT<sup>68</sup>. A read aligned by BLAT to both ends of the candidate sequence junction with a combined score  $\geq 90\%$  constituted a split read (e.g., Figure S3.6).

### In-Frame Gene Fusions

To report candidate gene fusions, we identified all candidate somatic rearrangements for which both ends of the novel adjacency in the tumor genome was in a coding region of the genome or a promoter of a gene defined as within 5 kb of the transcription start site. Rearrangements in which

both ends resided in the same gene were excluded as these may represent alternative isoforms. For each candidate fusion, we evaluated two possible orientations of the regions joined in the tumor genome, and for each orientation we extracted the full amino acid sequence of both the 5' and 3' transcripts as well as the candidate amino acid sequence that would be created by the fusion. We considered the fusion to be in-frame if the amino acid sequence of the 3' partner was a subsequence of the reference amino acid sequence.

### **Genome-wide Methylation Analyses**

We pre-processed and normalized raw IDAT files from the Infinium MethylationEPIC array using the preprocess Funnorm function in the R package minfi Aryee et al.<sup>69</sup>. Probes on chromosomes X or Y, probes with detection p value greater than 0.5, or probes overlapping a SNP with dbSNP minor allele frequency greater than 10% were excluded. In order to understand the similarity of ovarian cells lines with human ovarian cancer, we compared the ovarian cells lines with human ovarian cancer samples available from Genomic Data Commons (<https://gdc.cancer.gov/>). The Genomic Data Commons contained 533 human methylation profiles of ovarian cancer and eight normal fallopian tissue samples. Methylation of TCGA ovarian cancers was assessed using Infinium HumanMethylation27 BeadChip array (27,578 probes). The number of probes in common between the HumanMethylation27 platforms and the MethylationEPIC platform was 18,016. On the common set of 18,016 probes, we quantified overall methylation in the TCGA samples and the ovarian cell lines as the fraction of CpG sites with  $\beta > 0.3$ . To identify differentially methylated CpG sites comparing normal fallopian tissue to TCGA ovarian cancers, we selected probes from the common set of 18,016 that were hyper-methylated in TCGA ovarian cancer (average  $\beta > 0.4$ ) and unmethylated in normal fallopian tissue (average  $\beta < 0.2$ ). In addition, we also selected probes that were hypo-methylated in TCGA ovarian cancer (average  $\beta < 0.1$ ) and hyper-methylated in normal fallopian (average  $\beta > 0.3$ ).

## Gene Expression Analyses

Pre-processing and normalization of the 44k Agilent microarray for the ovarian cell lines has been previously described, and normalized expression data were available for 44 of the 45 tumors<sup>70</sup>. For copy number altered genes with known clinical relevance to cancer, we assessed whether amplified genes were overexpressed and whether deleted genes were underexpressed. The probability that a gene was overexpressed or underexpressed was estimated by a two-component pooled variance mixture model implemented in the R package CNPBayes (<https://bioconductor.org/packages/release/bioc/html/CNPBayes.html>). The location of the non-differentially expressed mixture component was fixed at the median log<sub>2</sub> expression of unmethylated cell lines without copy number alterations. A gene was considered differentially expressed if the posterior probability of membership in the overexpressed or underexpressed mixture component exceeded 0.5.

## Dose Response Models

### Bayesian Model Averaging

We considered models of the form  $\log C_i = \gamma_1 x_{i,1} + \dots + \gamma_p x_{i,p} + \epsilon_i$ , where  $C_i$  denotes the logIC<sub>50</sub> and  $x_{i,j}$  is an indicator for the alteration status (0, not altered; 1, altered) of feature  $j$  in cell line  $i$ . The regression coefficient for feature  $j$  is the product of a binary indicator  $z_j$  and a real number  $h_j$ . We used a modified g-prior for  $\gamma$  such that  $\gamma_j$  was zero whenever  $z_j$  was zero<sup>71</sup>. For the vector of  $\gamma$ 's with non-zero  $z$ 's, we used a multivariate normal prior. We explored the space of the possible  $2^p$  models using a Gibbs sampler. The binary features comprising the  $x$ 's included somatic mutations, somatic structural variants (deletions, amplifications, in-frame fusions), methylation, and underexpression or overexpression. For the PARP inhibitor, we additionally considered the

number of intra-chromosomal rearrangements and the HRD score as potential markers for HRD. For rearrangements, we computed the mean of the square-root-transformed frequency across all cell lines and defined a binary covariate for whether the square-root-transformed statistic was greater than the mean. We used the HRD score without transformation for Bayesian model averaging. For the univariate analyses described in the next section, we defined a binary covariate for HRD according to whether the score was larger than the mean. We obtained qualitatively similar inferences using the continuous HRD score (data not shown). For the inhibitor of the MEK pathway, one of the logIC50 concentrations was missing. For this cell line, we used the posterior mean from the imputation described in greater detail below.

#### Univariate Analysis of Selected Features

For a given feature, our sampling model for the length-3 vector of inhibitor concentrations inducing 20%, 50%, and 80% cell death is  $\log C_i, \text{altered} = \mu + \delta + \epsilon_i, \text{altered}$  for a cell line with an alteration in this feature and  $\log C_i, \text{WT} = \mu - \delta + \epsilon_i, \text{WT}$  for a cell line without an alteration. With inhibitor concentrations on the log scale, the residuals are approximately multivariate-normal:  $\epsilon_i, j \sim \text{i.i.d. MVN}(0, \Sigma)$ . Computationally convenient conjugate priors for the unknown parameters in this model are  $p(\mu, \delta, \Sigma) = p(\mu)p(\delta)p(\Sigma)$ ,  $\mu \sim \text{MVN}(\mu_0, \Sigma_0)$ ,  $\delta \sim \text{MVN}(\delta_0, \Psi_0)$ , and  $\Sigma^{-1} \sim W(\nu_0, S_0^{-1})$ . For some cell lines, inhibitor concentrations were incomplete. As the logC were highly correlated across cell lines, we imputed missing observations from the observed data using a Gibbs sampler. Inference regarding differences in mean logC, given by the posterior distribution of  $2\delta$ , was based on the marginal probability of the observed data integrating over the missing data. We reported 90% highest posterior density (HPD) intervals for the difference in the mean logIC50.

## RESULTS

### **Overall Approach**

We aimed to assemble a collection of ovarian cancer cell lines that would be representative of the different histological subtypes. These encompassed both publicly available as well as newly generated cell lines, ultimately comprising 19 serous, 9 clear-cell, 3 mucinous, 2 undifferentiated, 2 endometrioid, 1 mixed, and 9 unclassified subtypes (Table S3.1a). Information related to the original description and classification of these cell lines is indicated in Table S3.1a, and the origin of the lines was confirmed using unique short tandem repeat (STR) analyses. To identify sequence and structural changes in these ovarian cancer cell lines, we performed next-generation whole-genome analyses at an average coverage of 32x and 116.6 Gb per sample (Table S3.1c). As matched normal DNA was not available for these samples, we also sequenced a set of 18 unmatched DNA samples from normal blood or lymphoblastoid cell lines from individuals of various ethnicities. We developed approaches to focus on likely tumor-specific sequence and genome-wide structural changes, including amplifications, deletions, and rearrangements. In parallel, genome-wide methylation analyses were performed and integrated with genomic and expression data in order to obtain a comprehensive molecular profile of these samples (Figure 3.1).

### **Sequence analyses**

A high-sensitivity analysis of sequence alterations, including single-base substitutions and small insertions and deletions, was performed for the exomes of these samples. Given the challenges of characterizing tumor-specific (somatic) changes in tumor samples without matched normal tissue<sup>30</sup>, we developed stringent bioinformatic approaches to determine likely somatic mutations. Removal of common germline variants resulted in an average of 928 alterations per cell line exome,

comprising 41,768 changes that included rare germline and somatic alterations. Six cell lines (two clear cell and one each of endometrioid, serous, unclassified, and mixed lineage) were hypermutated, having alterations in mismatch repair (MMR) genes MLH1, MSH2, MSH6, or PMS2, and six times as many sequence changes compared to those tumors that were MMR proficient (Table S3.1d). To focus on likely somatic alterations involved in tumorigenesis, we analyzed the sequence alterations in each cell line and identified changes that have been previously detected in the coding genomes of other cancer patients<sup>72</sup>. We also identified nonsense or frameshift inactivating mutations in a panel of tumor suppressor genes (Table S3.1e). Through these analyses, we discovered 659 putative driver somatic mutations across 45 ovarian cell lines (Table S3.1f).

The most frequently mutated gene was the TP53 tumor suppressor gene (altered in 25 non-hypermutated and 3 hypermutated tumors). Excluding hypermutated samples, other genes frequently mutated included ARID1A (14 cancer cell lines), PIK3CA (6), SMAD4 (4), KRAS (4), APC (3), CREBBP (3), and PPP2R1A (3). Mutations were predominantly CpG transitions CT or GA (48%) followed by non-CpG transitions AG or CT (25%). These observations are consistent with mutations in TP53 in a high fraction of serous ovarian cancers<sup>16</sup>, and PIK3CA, ARID1A, and PPP2R1A in clear-cell tumors<sup>31</sup>. Analysis of mutation signatures aggregated by ovarian cancer subtypes revealed that serous, mucinous, and undifferentiated tumor cell lines had an age-related signature previously reported in ovarian adenocarcinomas<sup>61</sup>. Clear-cell and serous ovarian cancers also had a profile consistent with a MMR-associated mutation signature, likely due to the subset of tumors with MMR defects in the cell lines<sup>17</sup>. Overall, both the compendium of mutated genes as well as mutation-associated signatures were representative of previous ovarian cancer genome analyses (Table S3.1f).

### **Structural variant analyses**

Given the importance of structural alterations in the development of ovarian cancer<sup>16,17,32 13</sup>, we used whole-genome sequence data to characterize copy number changes as well as rearrangements that may affect key driver genes. We first considered existing approaches for whole-genome analyses, including DELLY and LUMPY, but these typically use matched normal sequences to accurately identify tumor-specific rearrangements<sup>62,63</sup>. Given the multitude of tumor cell lines and other cancer specimens where matched normal DNA is not available, we developed a framework for structural variant detection called Trellis that could be used with tumor genome sequence data directly. Additionally, because many structural changes are linked genomically (i.e., an amplified gene has both copy number changes and rearrangements that can be located in multiple locations of the genome), we aimed to connect the multiple changes that were related to individual genetic targets. The features of this approach include (1) detection of tumor-only structural changes through removal of germline and artifactual changes, (2) distinction of focal homozygous deletions and amplifications from larger structural changes, (3) connection of apparently disparate copy number regions using paired sequences in the same amplicons, (4) detection of homozygous and hemizygous deletions through copy number and rearrangement data, (5) confirmation of rearrangements using a stringent local re-alignment to detect and remove spurious paired read and split alignments, and (6) identification of in-frame rearrangements that would likely lead to gene fusions.

To implement the Trellis approach, we excluded low complexity sequences by mappability, as well as regions of germline copy number variants (CNVs) and rearrangements detected in the genomes of 18 samples derived from normal blood cells. We divided the remaining 2.7 Gb of the genome into 1-kb bins and examined areas of increased read density (2.75-fold) to identify copy number gains, and regions of decreased read density (0.6-fold) to detect hemizygous or homozygous deletions greater than 2 kb using approaches similar to digital karyotyping<sup>73,74</sup>. We identified rearrangements from atypical orientation or spacing of paired reads as well as split read alignments.

To evaluate the specificity of our approach in a set of non-tumor samples where we expected very few somatic structural changes, we used a leave-one-out cross-validation analysis among the 10 unmatched normal blood samples. Using Trellis, these analyses identified no focal high copy gains. On average, we identified 5 hemizygous deletions (interquartile range, 2–15) and 1 homozygous deletion (interquartile range, 0–8) in the normal samples (Figure 3.2). Likewise, the average number of rearrangements observed per sample was 3 (interquartile range, 0–6). These observations are consistent with previous descriptions of germline structural changes in normal DNA, in particular in lymphoblastoid DNA<sup>75</sup>, and suggest a high specificity of our approach for detection of bona fide somatic alterations (mean specificity, 0.97).

By contrast, analysis of normal samples with DELLY or LUMPY detected hundreds to thousands of structural changes in each normal DNA sample (Figure 3.2). With DELLY and LUMPY, the average numbers of focal high-quality copy number alterations were 13 and 21, respectively. The average numbers of intra- and inter-chromosomal rearrangements identified by DELLY were 297 and 433, respectively, and for LUMPY these were higher, at 511 and 2203, respectively. The number of alterations observed by DELLY using low-stringency settings was higher yet (Figure 3.2). False positives for copy number changes appeared to largely be due to inclusion of single-copy gains and losses, with neither DELLY nor LUMPY distinguishing hemizygous from homozygous losses or single-copy gains from high-copy amplifications. The source of the rearrangement false positives appeared to be largely the result of mapping artifacts due to low sequence complexity in putative rearrangements.

To assess the sensitivity of this approach, we sequenced 16 cell lines using high-coverage next-generation sequencing of 111 genes comprising 585,216 bp. Computing the fold change of read depth at these targeted regions, we found four high-copy amplifications with fold change 6, nine

low-copy amplifications with fold change and 6, and nine homozygous deletions. Trellis detected all four high-copy amplifications, including amplifications of AKT2, CCNE1, and KRAS. All nine regions identified as low-copy amplifications by targeted sequencing were also determined to be low-copy amplifications by Trellis, corroborating quantitative and qualitative characteristics of the amplifications. Similarly, all nine deletions discovered by targeted sequencing, comprising CDKN2A (8) and NF1 (1), were also characterized as homozygous deletions by Trellis. Overall, these analyses established that the Trellis approach had both high specificity and sensitivity for detection of structural alterations that are currently not possible with tumor-only samples using existing approaches.

### **Linked amplicons**

We focused our analysis of amplifications to regions smaller than 3 Mb that were present at 2.75-fold compared to the modal genome copy number, as such alterations have historically been linked to amplified driver genes<sup>74</sup>. An analysis of the 45 ovarian cancer samples identified 538 focal amplicons, or an average of 12 amplicons per tumor. As multiple amplicons within the same tumor may be derived from an amplification of a single target gene localized to different chromosomal regions<sup>74,76,77</sup>, we examined the possibility that amplicons may be linked. Using our paired read whole-genome analyses, we found that reads at the edges of many amplicons were linked with aberrant spacing and/or orientation with respect to the reference genome. In order to identify links between apparently distant amplicons, we visualized these as undirected graphs where the nodes were amplicons and edges between amplicons were defined by multiple paired reads aligned to both genomic locations (e.g., Figures 3.3A and 3.3B). Our analyses discovered 57 amplicon groups from the 538 amplicons across the ovarian tumor cell lines. Among tumors with at least one amplicon, the median number of amplicon groups was 2 and the median number of amplicons within an amplicon group was 4 (interquartile range, 2–9). The majority of cell lines (15/28) with

an amplicon group contained known driver genes. As an example, cell line ES-2 had 41 apparent amplicons, but through this approach we determined that 38 of the amplicons were linked to a single group that contained the CCND1 driver gene (Figure S4). Both the copy number ( $t = 3.3$ ,  $p = 0.003$ ) and number of connections between amplicons ( $t = 5.3$ ,  $p = 0.001$ ) was significantly higher for amplicon groups containing known drivers compared to amplicon groups without known drivers (Figure 3C).

Driver genes that were amplified in two or more cell lines as part of amplicon groups that have previously been observed in ovarian cancer included well-known oncogenes such as MYC (4), ERBB2 (2), CCND1 (2), CCNE1 (2), FGFR4 (2), and KRAS (2). Interestingly, we identified amplifications of cancer driver genes that have not been previously appreciated in ovarian cancer, including epigenetic regulator ASXL1 (2), H3 histone family member H3F3B (2), NOTCH family receptor NOTCH4 (1), repair and recombination paralog RAD51C (1), and ubiquitin ligase RNF43 (1). ASXL1 amplification and overexpression have been previously identified in cervical cancer<sup>78</sup>, and overexpression of H3F3B has been reported in several tumor types but not ovarian cancer<sup>79</sup>. Several of these genes have been observed as being part of larger structural alterations in recent TCGA high-grade serous ovarian carcinoma analyses<sup>16</sup> but have not been identified as target genes in those cases.

Overall, these analyses greatly simplified the observed amplification events and revealed that many focal amplicons would not have been associated with driver genes had they not been linked in specific amplicon groups. The observed amplicons were consistent with previously detected genes in ovarian cancer, but we also identified genes not previously implicated in this disease.

## **Deletions**

We used a combination of stringent analyses of segmented read depth and aberrant read pair spacing to identify homozygous and hemizygous deletions. As deletions may occur in the germline, we removed deletions that were in or near structural alterations observed in the normal controls in order to identify those deletions that were most likely to be somatic. These analyses revealed 674 hemizygous<sup>+</sup>, 41 overlapping hemizygous<sup>+</sup>, 286 homozygous, and 263 homozygous<sup>+</sup> deletions, where “+” denotes evidence for deletion supported by rearranged read pairs in addition to read depth (Figures 3.3D; Table S3.1h). Deletion breakpoints with rearranged read pairs were more precise (typically within 100 bp), while deletions without rearranged read pairs had a resolution of 1–5 kb. We included homozygous deletions from segmentation analyses even if these were without rearranged read pairs as these could have been missed in read pair analyses due to the limited mappability at one or both deletion breakpoints. The median number of homozygous and hemizygous deletions per tumor was 10.5 (interquartile range, 8–16) and 11.0 (interquartile range, 6–18), respectively. Genes that were recurrently deleted included cell cycle regulators CDKN2A (9) and CDKN2B (8), tyrosine kinase receptor ERBB4 (5), neurofibromin genes NF1 (3) and NF2 (3), transcriptional regulator CDC73 (2), polycomb-group repressor EZH2 (2), and serine/threonine kinase STK11 (2) (Table S1h), of which CDKN2A, NF1, NF2, and STK11 have been previously reported to be altered in high-grade serous ovarian carcinomas<sup>16,80</sup>. Genes that have been implicated through somatic deletion in other tumors but that had not been previously implicated in ovarian cancer include CDC73, ERBB4, EZH2, MLH1, as well as TGF-beta pathway members TGFBR2, SMAD3, and SMAD4, estrogen receptor ESR1, cell cycle kinase CDK6, notch receptor NOTCH1, cohesin member STAG2, and epigenetic regulator ATRX (Table S3.1h). In a fashion similar to amplifications, several of these genes have been observed as being part of larger structural alterations in recent TCGA high-grade serous ovarian carcinoma analyses<sup>16</sup> but have not been identified as target genes in those cases or other histologic subtypes. The absence or low frequency of such alterations in previous studies may in part reflect the challenges of identifying bona fide deletions through existing approaches in primary tumors.

Other recurrent deletions occurred in genes encompassing large genomic regions (>1 Mb) that were more likely to be affected by structural alterations, including a member of the low-density lipoprotein receptor family LRP1B (7), fragile histidine triad involved in purine metabolism FHIT (11), a member of the short-chain dehydrogenases/reductases protein family WWOX (15), and the deacetylase MACROD2 (7). FHIT and WWOX occur in fragile sites and are often deleted in cancers, and some evidence suggests they encode putative tumor suppressors<sup>81-84</sup>. LRP1B deletion has been associated with chemotherapy resistance in high-grade serous ovarian cancers and is a putative tumor suppressor<sup>85</sup>. Because of their proximity to CDKN2A, the methylthioadenosine phosphorylase MTAP and the transcription factor DMRT1 are commonly co-deleted with CDKN2A<sup>86</sup>, and use of compounds exploiting the loss of MTAP has been proposed as a potential therapeutic avenue<sup>87</sup> for tumors with CDKN2A deletions.

### **Rearrangements and fusions**

We next examined structural rearrangements that were not associated with segmental copy number changes. We detected 834 inter-chromosomal and 2,277 intra-chromosomal rearrangements (Table S3.1i). The median per sample of inter- and intra-chromosomal rearrangements was 16 (interquartile range, 5–31) and 37 (interquartile range, 17–62), respectively, with many of these rearrangements involving inversions (median of 8 and 6, respectively).

Among rearrangements for which the sequence junction was within the intron or exon of a gene, we detected 128 in-frame fusions of two genes (Table S3.1j). Several of these in-frame fusions have not been observed in ovarian cancer but have been previously reported in other cancers. For example, YAP1-MAML2 has been reported in nasopharyngeal carcinoma and salivary cancers<sup>88-90</sup>, IKZF2-ERBB4 has been reported in T cell lymphomas<sup>91</sup>, and fusions involving CCND1 were

identified in a patient with leukemic mantle cell lymphoma<sup>92</sup>. Our study discovered the YAP1-MAML2 fusion in cell line ES-2 after exon 6 of YAP1 and before exon 2 of MAML2, preserving the transactivation domain of MAML2 and its likely role in Notch signaling. The predicted amino acid sequence of the affected MAML2 gene is the same as reported in nasopharyngeal carcinoma and salivary gland cancers (amino acid 172)<sup>88-90</sup>.

The IKZF2-ERBB4 fusion we identified in ovarian tumor KK involves the first three exons of IKZF2 and exons 2–27 of ERBB4, a member of the epidermal growth factor receptor (EGFR) family. This IKZF2-ERBB4 junction is nearly identical to that reported by Boddicker et al.<sup>91</sup> in T cell lymphoma and mucinous lung adenocarcinoma, involving the same exons of ERBB4 and leaving the ERBB4 kinase domain intact. Gene expression analyses indicated that the ERBB4 transcript, including the fusion transcript, was overexpressed. ERBB4 overexpression has been associated with resistance to platinum-based therapy in ovarian serous carcinomas<sup>93</sup>, suggesting a potentially important role for this translocation event for therapeutic selection. In ovarian tumor ES-2, CCND1 was amplified and also participated in a fusion where the promoter of SHANK2 was linked to the coding region of CCND1. An amplification and fusion involving CCND1 has been previously identified in a patient with leukemic mantle cell lymphoma<sup>92</sup>. Additional gene fusions not previously observed in ovarian cancer involved the negative regulator of the RAS pathway NF1, the tumor suppressor regulating mTORC1 signaling TSC2, and the member of the F-box protein family FBXW7. The fusion of NF1 (NF1-MYO1D) occurred after the first exon of this gene and would be expected to disrupt its function, consistent with its tumor-suppressive role Cancer Genome Atlas Research Network<sup>16</sup>. Similarly, the fusion of MLST8-TSC2 would be expected to result in a TSC2 protein lacking the first 373 aa, disrupting the key region of interaction with TSC1<sup>94</sup>. As detailed below, the fusion of full-length FBXW7 to the promoter of FAM160A1 was also likely deleterious due to decreased expression under the new promoter. For each of the nine predicted fusions involving at least one gene previously identified in other cancer fusions, we

independently validated the novel sequence junction using PCR and Sanger sequencing and a recently developed droplet digital PCR approach<sup>95</sup>.

### **Epigenetic and expression analyses**

We next examined genome-wide methylation profiles in order to evaluate the role of epigenetic alterations in these ovarian cancer cell lines. Analyses of over 850,000 methylation sites were performed using Infinium MethylationEPIC arrays. Methylation levels were evaluated at individual CpG sites within gene promoter regions (1,500 bp upstream of the transcription start site) or within individual genes. We compared methylation levels in the ovarian cell lines to methylation levels in the normal lymphoblastoid cells, as well as to 8 TCGA normal fallopian tissue and 533 TCGA ovarian cancers. Among the 18,619 CpG probes shared by the Infinium HumanMethylation27 BeadChip array (27,578 probes) and the MethylationEPIC array, we estimated the proportion of methylated CpG sites as the fraction of CpG probes with  $\beta > 0.3$ . Consistent with previous studies<sup>96-98</sup>, we found that the overall proportion of methylated CpG sites in the lymphoblastoid (median, 0.35) and ovarian cell lines (median, 0.41) was higher than the proportion in fallopian tissues (median, 0.30) and ovarian cancers (median, 0.29) (Figure 3.4A). Previous studies have suggested that differences in methylation between cell cultures and primary tumors often occur at genes involved in cell cycle regulation<sup>98</sup>, and may also result from contamination of normal cells in the primary tissues. To examine methylation profiles of the cell lines at individual CpG sites in the broader context of ovarian cancer methylation profiles, we identified 96 genes that were differentially methylated between normal fallopian tissue and 100 randomly sampled TCGA ovarian tumors (Figure 3.4B). While we excluded both the lymphoblastoid cell lines and the ovarian cancer cell lines from the probe selection procedure, the normal lymphoblastoid cell lines were more highly correlated to the normal fallopian tissues while the ovarian cancer cell lines were more correlated to the TCGA ovarian cancers. Taken together, these analyses indicate that the

ovarian cell lines retain epigenetic profiles of genes commonly methylated in ovarian cancer and that the methylation of these genes is unlikely to be related to growth in culture.

We integrated our genomic and epigenetic analyses with expression data previously obtained for these cell lines through the Agilent 44K array<sup>70</sup>. We assessed whether specific genes affected by deletions or other structural changes in some tumors may be silenced through methylation and low expression in others. Among genes that were methylated or deleted, expression analyses revealed lower expression for many of these genes. Cell lines RMG-I and IGROV-1 both had hemizygous deletion and loss of expression of CDC73. Of the 13 drivers homozygously deleted in at least one tumor, five genes, including CDKN2A and ESR1, displayed loss of expression and concomitant promoter methylation in additional ovarian cancers (Figures 3.4C). When promoter methylation and underexpression were considered, the fraction of tumors with alterations in CDKN2A more than doubled from 23% to 55%, highlighting the multiple mechanisms by which CDKN2A function can be compromised. Similarly, MLH1 was mutated in a single case, but was mutated and/or underexpressed in an additional seven cancers. For ESR1, the inactivating methylation is thought to be associated with age and has been previously observed in both ovarian cancers and ovarian cancer cell lines<sup>99,100</sup>. Lower expression also resulted from abnormal fusion of non-adjacent promoters to the full coding sequence of target genes. In OVCAR-8, the fusion of the promoter of FAM160A1 with the full-length FBXW7 gene resulted in dramatically decreased expression of FBXW7, consistent with the tumor-suppressive function of this protein and inactivating mutations observed in other tumor types<sup>101</sup>.

We also examined the possibility of increased expression for genes with structural changes. We identified 17 genes with focal amplification in one or more cancer cell lines and evidence of bimodal expression across the samples analyzed. For these genes, 20 of the 22 tumors (91%) with focal amplification also had increased expression. Genes associated with amplification and fusion

had particularly high expression, suggesting that the combination of genetic alterations led to increased overall transcription of these genes. The amplification of CCND1 and its fusion to SHANK2 in sample ES-2 increased the expression of CCND1 relative to other ovarian cell lines without the amplification and fusion. The YAP1-MAML2 fusion, which was also duplicated in the same sample, resulted in expression of MAML2 that was higher than 85% of the other ovarian cancer cell lines. For driver genes that were amplified, we examined whether additional tumors may be identified with increased expression of these genes. We found increased expression of CCNE1, ERBB2, KRAS, and AKT2 in eight additional cases without genomic alterations in these genes (Figure 3.5). These analyses indicate the importance of integrated genomic, epigenetic, and expression analyses and have resulted in an expansion of the number of tumors with alterations in key driver genes. These observations also highlight the functional consequences of genomic and epigenomic alterations in human cancer at the RNA level.

Combining sequence and structural variants with methylation and differential gene expression, we found that nearly all ovarian cancer subtypes had alterations in cell cycle, chromatin remodeling, DNA repair, RAS, Notch, PI3K, or TGFB signaling pathways (Figure 3.5). Alterations in the cell cycle pathway genes, including CDKN2A, were the most common with one or more alterations in 60%–70% of the three most represented subtypes (serous, adenocarcinoma, and clear cell). Chromatin modifications occur in 5/7 (71%) of the clear-cell subtypes but in only 2/21 (11%) of the serous samples. We see evidence of mutual exclusivity between CDKN2A, CCNE1, and RB1 within the cell cycle pathway, but not mutual exclusivity between cell cycle and KRAS pathways, underscoring that clonal selection often involves multiple drivers regulating distinct molecular processes.

### **Sensitivity and resistance to pathway inhibitors**

To begin to understand the relationship between genomic, epigenetic, and expression alterations and response to pathway inhibitors, we developed a screening platform for evaluating cellular proliferation in the presence of candidate therapeutic agents. As an example of the analyses that can be performed and the genotype-phenotype connections that can be obtained, we measured IC<sub>20</sub>, IC<sub>50</sub>, and IC<sub>80</sub> after 7 days of incubation for three inhibitors, GNE-493, BMN673, and MEK162, targeting PI3K, PARP, and MEK proteins, respectively (Table S3.1k). Aggregating the molecular information from multiple platforms to the gene level, we limited our analyses to genes that were altered in 3 or more of the 45 cell lines. Alterations that tend to be mutually exclusive between cell lines were combined, including genes in the PI3K pathway (PIK3CA and PPP2R1A) and the genes in the TGFBR pathway (SMAD3 and SMAD4). As tumors with homologous recombination deficiencies (HRDs) have been known to be sensitive to PARP inhibitors, we additionally added covariates summarizing the extent of genome-wide structural alterations for the PARP inhibitor BMN673. A priori, we hypothesized that most alterations would not modulate response to the targeted inhibitors. Implementing a Bayesian model averaging approach to variable selection as has been previously considered for other biomarkers<sup>102-104</sup>, we specified a positive prior probability that the coefficient for each gene is exactly zero. Given the genes or combination of genes and structural variant summaries, we explored the space of possible single and multi-variate models for logIC<sub>50</sub> by Markov chain Monte Carlo. Relevant posterior summaries available for each inhibitor include the probability that the regression coefficient is non-zero and the posterior distribution of the regression coefficients. We used this approach to focus on those features that were present in at least half of the models as these had a higher probability of being predictive for drug response (Figure 3.6A).

For PARP inhibition by BMN673, our analyses revealed that the number of genome-wide rearrangements and amplification of MYC were important predictors of drug sensitivity (Figure 3.6). Importantly, the two cell lines with inactivating BRCA1/2 mutations, as well as the HRD

score as defined by Abkevich et al. or Swisher et al. and applied through our whole-genome analyses, and PARP1 expression showed a trend toward increased sensitivity to PARP inhibition but were not statistically significant (Figure 3.6). We found that amplification of MYC or an increase in the number of genome-wide rearrangements, including inversions and intra-chromosomal rearrangements, were significantly associated with sensitivity to this therapy, appearing in 94% of the single-variate and multi-variate models. We estimated the difference of the mean log IC<sub>50</sub> between the group of tumors with alterations in these features and the group of tumors without such changes, revealing a 93% (90% confidence interval [CI], 99%–64%) and 86% (90% CI, 96%–43%) increased sensitivity to PARP inhibition for cell lines with MYC amplification and increased rearrangements, respectively (Figure 3.6). Although other genomic signatures and PARP1 expression have been suggested as biomarkers for PARP sensitivity<sup>105</sup>, MYC amplification and rearrangements have not been previously identified as markers of PARP sensitivity in serous and endometrioid ovarian cancers. Taken together, these observations suggest that alterations of common drivers along with large-scale structural alterations in ovarian cancer may identify tumors with high sensitivity to this therapy.

For inhibition of the PI3K pathway by GNE-493, mutations of PPP2R1A or PIK3CA appeared in more than 75% of the models evaluated. Cancer cell lines with mutations in PARP1 or PPP2R1A had a 66% increased sensitivity to GNE-493 (Figure 3.6). PPP2R1A is a subunit of protein phosphatase 2A (PP2A), a known tumor suppressor and regulator of PI3K signaling through AKT inhibition<sup>106</sup>. Somatic mutations in PIK3CA and PPP2R1 have been previously reported in ovarian and uterine cancers<sup>13,30,107,108</sup>. Our observations suggest that PI3K inhibitors counter the loss of PI3K pathway regulation from inactivating mutations of PPP2R1A and activating mutations of PIK3CA.

For the MEK pathway, mutations or deletions in SMAD3 or SMAD4 were predictive of IC<sub>50</sub> levels in response to the inhibitor MEK-162. These were selected in more than 85% of the models and resulted in an increased sensitivity of 89% to this therapy. SMAD3 and SMAD4 form a complex that activates transcription of TGF-beta-regulated genes important in cellular growth control<sup>109</sup>. Our results are consistent with previous observations showing that loss of SMAD4 can lead to activation of Smad-independent MEK/ERK pathway signaling and that inhibition of this pathway with MEK inhibitors can reverse tumorigenic effects<sup>110</sup>.

**Figure 3.2. Number of False-Positive Somatic Structural Variant Identifications in Lymphoblastoid Cell Lines.** (A and B) Estimated number of false-positive somatic deletions and duplications (A) and somatic intra-chromosomal and inter-chromosomal rearrangements (B).

**Figure 3.3. Trellis Approach for Characterization of Genomic Structural Alterations.** (A) Circos plot displaying focal deletions (green), amplifications (orange), and intra- and inter-chromosomal rearrangements (blue) for cell line FU-OV-1. (B) Improperly paired reads established connections (edges) between distant amplicons (nodes) visualized as a graph. The size of the plotting symbols is proportional to the number of sites in which the amplicon was inserted, and the triangle shape indicates an amplicon involving a known driver. (C) The average maximum copy number (top) and mean number of amplicon links (bottom) for amplicon groups with and without drivers. (D) Top: Segmented normalized coverage identified a homozygous deletion (shaded). Bottom: Rearranged read pairs improved the precision of the deletion breakpoints. Lines connecting the read pairs indicate whether the positive or negative strand was sequenced (blue, positive; green, negative).

**Figure 3.4. Methylation of CpG Sites in Ovarian Cancers and Normal Fallopian Tissue.** (A) The proportion of methylated CpG sites (mean) in the lymphoblastoid cell lines, ovarian cell lines, TCGA ovarian cancers, and TCGA normal fallopian tissues. (B) Plotted are 96 probes that were differentially methylated between normal TCGA fallopian tissue and 100 randomly selected TCGA ovarian tumors (blue points, A). Among these probes, the lymphoblastoid cell lines were most correlated with normal fallopian tissue and the ovarian cell lines were most correlated with TCGA ovarian tumors, suggesting that the cell line effect does not dominate among probes that were differentially methylated in these tissues. Among probes that were methylated in TCGA ovarian and unmethylated in TCGA fallopian, the ovarian cell lines were predominantly methylated and have quantitatively higher  $\beta$  values. While copy number analyses suggested that the purity in the ovarian cell lines was , the median tumor purity of TCGA ovarian tumors was 85% (interquartile range, 78%–88%). (C) Genes CDKN2A and ESR1 exhibit bimodal gene expression explained by homozygous copy number deletions (blue points in x-axis margin) or methylation levels above 0.2.

**Figure 3.6. Sensitivity and Resistance to Pathway Inhibitors.** (A) Bayesian model averaging was used to identify features associated with response to drug. Features selected in fewer than half of the multi-variate models have a posterior probability of being non-zero  $\leq 0.5$  (vertical dashed line, left) and a posterior median of zero (right). (B) Boxplots of inhibitor concentrations for features selected by this approach, as well as HRD, *PARP1*, and *BRCA1/2* (left). The two cell lines with *BRCA1/2* mutations are indicated by triangles in the PARP pathway. Right: The difference in mean log $IC_{50}$  concentrations by alteration status and the 90% highest posterior density (HPD) interval for the difference.

\* Hypermutated cell lines have mutations in one or more MMR genes and more than 2000 alterations after exclu

**Table S3.1e. Driver genes evaluated for inactivating mutations**

Gene symbol	Gene name
POLL	polymerase (DNA directed), lambda
RPA1	replication protein A1, 70kDa
NEIL1	nei endonuclease VIII-like 1 (E. coli)
NEIL2	nei endonuclease VIII-like 2 (E. coli)
NTHL1	nth endonuclease III-like 1 (E. coli)
PNKP	polynucleotide kinase 3'-phosphatase
APTX	aprataxin
TDP1	tyrosyl-DNA phosphodiesterase 1
OGG1	8-oxoguanine DNA glycosylase
AGPAT9	1-acylglycerol-3-phosphate O-acyltransferase
UNG	uracil-DNA glycosylase
APEX1	APEX nuclease (multifunctional DNA repair enzyme)
APEX2	APEX nuclease (apurinic/apyrimidinic endonuclease)
POLB	polymerase (DNA directed), beta
FEN1	flap structure-specific endonuclease 1
ALKBH2	alkB, alkylation repair homolog 2 (E. coli)
ALKBH3	alkB, alkylation repair homolog 3 (E. coli)
XAB2	XPA binding protein 2
CCNH	cyclin H
CDK7	cyclin-dependent kinase 7
CETN2	centrin, EF-hand protein, 2
DDB1	damage-specific DNA binding protein 1, 127kDa
ERCC6	excision repair cross-complementation group 6
ERCC7	excision repair cross-complementation group 7
ERCC8	excision repair cross-complementation group 8
LIG1	ligase I, DNA, ATP-dependent
MNAT1	MNAT CDK-activating kinase assembly factor
MMS19	MMS19 nucleotide excision repair homolog (S. cerevisiae)
RAD23A	RAD23 homolog A (S. cerevisiae)
RAD23B	RAD23 homolog B (S. cerevisiae)
RPA2	replication protein A2, 32kDa
GTF2H5	general transcription factor IIH, polypeptide 5
RAD51B	RAD51 paralog B
RAD51D	RAD51 paralog D
XRCC2	X-ray repair complementing defective repair in Chinese hamster cells 2
XRCC3	X-ray repair complementing defective repair in Chinese hamster cells 3
MUS81	MUS81 structure-specific endonuclease subunit
EME1	essential meiotic structure-specific endonuclease

ATR	ATR serine/threonine kinase
BARD1	BRCA1 associated RING domain 1
MRE11A	MRE11 meiotic recombination 11 homolog A (S. cerevisiae)
RAD50	RAD50 homolog (S. cerevisiae)
RAD51	RAD51 recombinase
DCLRE1C	DNA cross-link repair 1C
XRCC6	X-ray repair complementing defective repair in Chinese hamster cells 6
XRCC5	X-ray repair complementing defective repair in Chinese hamster cells 5 (dimeric)
XRCC4	X-ray repair complementing defective repair in Chinese hamster cells 4
PRKDC	protein kinase, DNA-activated, catalytic polypeptide chain
HELQ	helicase, POLQ-like
POLG	polymerase (DNA directed), gamma
POLI	polymerase (DNA directed) iota
POLK	polymerase (DNA directed) kappa
POLM	polymerase (DNA directed), mu
POLN	polymerase (DNA directed) nu
POLQ	polymerase (DNA directed), theta
SLX4	SLX4 structure-specific endonuclease subunit 4
H2AFX	H2A histone family, member X
CHAF1A	chromatin assembly factor 1, subunit A (p150)
RECQL	RecQ helicase-like
RECQL5	RecQ protein-like 5
MSH3	mutS homolog 3
MLH3	mutL homolog 3
EXO1	exonuclease 1
CHEK1	checkpoint kinase 1
MDC1	mediator of DNA-damage checkpoint 1
TP53BP1	tumor protein p53 binding protein 1
C11orf30	chromosome 11 open reading frame 30
ERCC4	excision repair cross-complementation group 4
RAD51C	RAD51 paralog C
RAD51C	RAD51 homolog C (S. cerevisiae)
BRIP1	BRCA1 interacting protein C-terminal helicase 1
BRCA2	breast cancer 2, early onset
PALB2	partner and localizer of BRCA2
PALB2	partner and localizer of BRCA2
FANCL	Fanconi anemia, complementation group L
XRCC1	X-ray repair complementing defective repair in Chinese hamster cells 1
DDB2	damage-specific DNA binding protein 2, 48kDa
ERCC1	excision repair cross-complementation group 1

ERCC2	excision repair cross-complementation group 2
ERCC3	excision repair cross-complementation group 3
ERCC5	excision repair cross-complementation group 5
ATM	ATM serine/threonine kinase
CHEK2	checkpoint kinase 2
TP53	tumor protein p53
BRCA1	breast cancer 1, early onset
NBN	nibrin
POLE	polymerase (DNA directed), epsilon, catalytic subunit
POLH	polymerase (DNA directed), eta
FANCC	Fanconi anemia, complementation group C
FANCD2	Fanconi anemia, complementation group D2
FANCB	Fanconi anemia, complementation group B
FANCA	Fanconi anemia, complementation group A
FANCE	Fanconi anemia, complementation group E
FANCF	Fanconi anemia, complementation group F
FANCG	Fanconi anemia, complementation group G
FANCI	Fanconi anemia, complementation group I
FANCM	Fanconi anemia, complementation group M
ATRX	alpha thalassemia/mental retardation syndrome X-linked
RECQL4	RecQ protein-like 4
MSH2	mutS homolog 2
MSH6	mutS homolog 6
MLH1	mutL homolog 1
PMS1	PMS1 postmeiotic segregation increased 1 (S. cerevisiae)
PMS2	PMS2 postmeiotic segregation increased 2 (S. cerevisiae)
PTEN	phosphatase and tensin homolog
PIK3R1	phosphoinositide-3-kinase, regulatory subunit 1 (alpha)
MAX	MYC associated factor X
ARID1A	AT rich interactive domain 1A (SWI-like)
ARID1B	AT rich interactive domain 1B (SWI1-like)
SMARCA4	SWI/SNF related, matrix associated, actin dependent regulator of chromatin
SMARCA2	SWI/SNF related, matrix associated, actin dependent regulator of chromatin
NF1	neurofibromin 1
CREBBP	CREB binding protein
mTOR	mechanistic target of rapamycin (serine/threonine kinase)
MLL	myeloid/lymphoid or mixed-lineage leukemia (trithorax homolog)
MLL2	myeloid/lymphoid or mixed-lineage leukemia
MLL3	myeloid/lymphoid or mixed-lineage leukemia
NBS1	Nijmegen Breakage Syndrome 1

ATXN1	ataxin 1
AR	androgen receptor
ARMC4	armadillo repeat containing 4
DRD4	dopamine receptor D4
EP300	E1A binding protein p300
ERBB2	v-erb-b2 erythroblastic leukemia viral oncogene homolog 2, neuro/glioblastoma
ANK3	ankyrin 3, node of Ranvier (ankyrin G)
APC	adenomatous polyposis coli
CACNA1S	calcium channel, voltage-dependent, L type, alpha 1S
FCGBP	Fc fragment of IgG binding protein
FLG	filaggrin
GRM8	glutamate receptor, metabotropic 8
HYDIN	HYDIN, axonemal central pair apparatus prote
KIAA1217	uncharacterized protein
KIF3A	kinesin family member 3A
NAA16	N(alpha)-acetyltransferase 16, NatA auxiliary sub
NFE2L2	nuclear factor (erythroid-derived 2)-like 2
OR52B4	olfactory receptor, family 52, subfamily B, memb
PPP2R1A	protein phosphatase 2, regulatory subunit A, alp
RAB17	RAB17, member RAS oncogene family
RELN	reelin
REST	RE1-silencing transcription factor
RET	ret proto-oncogene
RIPK1	receptor (TNFRSF)-interacting serine-threonine kin
SIGLEC10	sialic acid binding Ig-like lectin 10
SLC2A7	solute carrier family 2 (facilitated glucose transporter),
SMAD4	SMAD family member 4
SPEF2	sperm flagellar 2
USH2A	Usher syndrome 2A (autosomal recessive, milo
VPS13A	vacuolar protein sorting 13 homolog A (S. cerevis
ZFHX4	zinc finger homeobox 4
ZNF426	zinc finger protein 426
ABL1	c-abl oncogene 1, non-receptor tyrosine kinase
ACVR1C	activin A receptor, type IC
ACVR1B	activin A receptor, type IB
ALK	anaplastic lymphoma receptor tyrosine kinase
ASXL1	additional sex combs like 1 (Drosophila)
AURKA	aurora kinase A
AXIN2	axin 2
BAP1	BRCA1 associated protein-1 (ubiquitin carboxy-terminal

BCL2	apoptosis regulator
BCR	breakpoint cluster region
BLM	Bloom syndrome, RecQ helicase-like
BMPR1A	bone morphogenetic protein receptor, type IA
BTK	Bruton agammaglobulinemia tyrosine kinase
CALR	calreticulin
CBL	Cbl proto-oncogene, E3 ubiquitin protein ligase
CCND1	cyclin D1
CCNE1	cyclin E1
CDC73	cell division cycle 73
CDH1	cadherin 1
CDK4	cyclin-dependent kinase 4
CDK6	cyclin dependent kinase 6
CDKN1B	cyclin-dependent kinase inhibitor 1B (p27, Kip1)
CDKN2A	cyclin-dependent kinase inhibitor 2A
CDKN2C	cyclin-dependent kinase inhibitor 2C (p18, inhibits Cdk2)
CEBPA	CCAAT/enhancer binding protein (C/EBP), alpha
CIC	capicua homolog (Drosophila)
CSF1R	colony stimulating factor 1 receptor
CYLD	cylindromatosis (turban tumor syndrome)
DAXX	death-domain associated protein
DDR2	discoidin domain receptor tyrosine kinase 2
DICER1	dicer 1, ribonuclease type III
DNMT3A	DNA (cytosine-5-)-methyltransferase 3 alpha
EGFR	epidermal growth factor receptor
ERBB3	v-erb-b2 erythroblastic leukemia viral oncogene homolog 3
ERBB4	v-erb-a erythroblastic leukemia viral oncogene homolog 4
ESR1	estrogen receptor 1
ETV1	ets variant 1
ETV5	ETS variant 5
EWSR1	Ewing sarcoma breakpoint region 1
EXT1	exostosin 1
EXT2	exostosin 2
EZH2	enhancer of zeste homolog 2 (Drosophila)
FGFR1	fibroblast growth factor receptor 1
FGFR2	fibroblast growth factor receptor 2
FGFR3	fibroblast growth factor receptor 3
FGFR4	fibroblast growth factor receptor 4
FH	fumarate hydratase
FLCN	folliculin

FLT3	fms-related tyrosine kinase 3
FLT4	fms-related tyrosine kinase 4
FOXL2	forkhead box L2
GATA1	GATA binding protein 1
GATA2	GATA binding protein 2
GNA11	guanine nucleotide binding protein (G protein), alpha 11
GNAQ	guanine nucleotide binding protein (G protein), q polypeptide
GNAS	GNAS complex locus
GPC3	glypican 3
H3F3A	H3 histone family member 3A
H3F3B	H3 histone family member 3B
HNF1A	HNF1 homeobox A
IDH1	isocitrate dehydrogenase 1 (NADP+), soluble
IDH2	isocitrate dehydrogenase 2 (NADP+), mitochondrial
IGF1R	insulin-like growth factor 1 receptor
IGF2R	insulin-like growth factor 2 receptor
IKZF1	IKAROS family zinc finger 1 (Ikaros)
JAK1	Janus kinase 1
JAK2	Janus kinase 2
JAK3	Janus kinase 3
KDR	kinase insert domain receptor (a type III receptor tyrosine kinase)
KIT	v-kit Hardy-Zuckerman 4 feline sarcoma viral oncogene homolog
MAML1	mastermind-like 1 (Drosophila)
MAP2K1	mitogen-activated protein kinase kinase 1
MAP2K4	mitogen-activated protein kinase kinase 4
MDM2	Mdm2, p53 E3 ubiquitin protein ligase homolog (mouse)
MDM4	Mdm4 p53 binding protein homolog (mouse)
MED12	mediator complex subunit 12
MEN1	multiple endocrine neoplasia I
MET	met proto-oncogene (hepatocyte growth factor receptor)
MPL	myeloproliferative leukemia virus oncogene
MUTYH	mutY DNA glycosylase
MYC	v-myc myelocytomatosis viral oncogene homolog (c-myc)
MYCL1	v-myc myelocytomatosis viral oncogene homolog 1, lung carcinoma
MYCN	v-myc myelocytomatosis viral related oncogene, neuroblastoma
MYD88	myeloid differentiation primary response 88
NCOA3	nuclear receptor coactivator 3
NF2	neurofibromin 2 (merlin)
NKX2-1	NK2 homeobox 1
NOTCH1	notch 1

NOTCH3	notch 3
NOTCH4	notch 4
NPM1	nucleophosmin (nucleolar phosphoprotein B23, num)
NTRK1	neurotrophic tyrosine kinase, receptor, type 1
PALB2	partner and localizer of BRCA2
PALB2	partner and localizer of BRCA2
PAX5	paired box 5
PBRM1	polybromo 1
PDGFRA	platelet-derived growth factor receptor, alpha polyp
PHOX2B	paired-like homeobox 2b
POLD1	polymerase (DNA directed), delta 1, catalytic sub
POT1	protection of telomeres 1
PRKAR1A	protein kinase, cAMP-dependent, regulatory, type I,
PRSS1	serine protease 1
PTCH1	patched 1
PTPN11	protein tyrosine phosphatase, non-receptor type
RAD51C	RAD51 paralogue C
RAD51C	RAD51 homolog C (S. cerevisiae)
RAF1	v-raf-1 murine leukemia viral oncogene homolog
RNF43	ring finger protein 43
RUNX1	runt-related transcription factor 1
SBDS	SBDS, ribosome maturation factor
SDHAF2	succinate dehydrogenase complex assembly facto
SDHB	succinate dehydrogenase complex, subunit B, iron su
SDHC	succinate dehydrogenase complex subunit C
SDHD	succinate dehydrogenase complex, subunit D, integral mem
SF3B1	splicing factor 3b, subunit 1, 155kDa
SMAD2	SMAD family member 2
SMAD3	SMAD family member 3
SMARCB1	SWI/SNF related, matrix associated, actin dependent regulator of chroma
SMO	smoothened, frizzled family receptor
SRC	SRC proto-oncogene, non-receptor tyrosine kina
STAG2	stromal antigen 2
SUFU	suppressor of fused homolog (Drosophila)
TERT	telomerase reverse transcriptase
TET2	tet methylcytosine dioxygenase 2
TGFB2	transforming growth factor, beta receptor II (70/80
TNFAIP3	tumor necrosis factor, alpha-induced protein 3
TOP1	topoisomerase (DNA) I
TSC1	tuberous sclerosis 1

TSC2	tuberous sclerosis 2
TSHR	thyroid stimulating hormone receptor
WAS	Wiskott-Aldrich syndrome
WRN	Werner syndrome, RecQ helicase-like
WT1	Wilms tumor 1
XPA	DNA damage recognition and repair factor
XPC	xeroderma pigmentosum, complementation group C
DNAJB1	DnaJ heat shock protein family (Hsp40) member B1
ETV4	ets variant 4
ETV6	ETS variant 6
PDGFRB	platelet-derived growth factor receptor, beta polypeptide
PRKACA	protein kinase, cAMP-dependent, catalytic, alpha
RARA	retinoic acid receptor, alpha
TACC3	transforming, acidic coiled-coil containing protein 3
TMPRSS2	transmembrane protease, serine 2
AKT2	AKT serine/threonine kinase 2
CTNNB1	catenin (cadherin-associated protein), beta 1, 88kDa
ACVR1	activin A receptor type 1
AKT1	v-akt murine thymoma viral oncogene homolog 1
BUB1B	BUB1 mitotic checkpoint serine/threonine kinase B
CDKN2B	cyclin dependent kinase inhibitor 2B
VHL	von Hippel-Lindau tumor suppressor, E3 ubiquitin protein ligase
SMARCC1	SWI/SNF related, matrix associated, actin dependent regulator of chromatin subunit family class C member 1
SMARCD2	SWI/SNF related, matrix associated, actin dependent regulator of chromatin subunit family class D member 2
SMARCE1	SWI/SNF related, matrix associated, actin dependent regulator of chromatin subunit family class E member 1
FBXW7	F-box and WD repeat domain containing 7, E3 ubiquitin protein ligase
NOTCH2	notch 2
AXIN1	axin 1
PARP1	poly (ADP-ribose) polymerase 1
STK11	serine/threonine kinase 11
ROS1	c-ros oncogene 1 , receptor tyrosine kinase

\* Deletions were identified by segmentation of the normalized read depth. Deletions were called as hemizygous+ (Start, End) were refined based on the alignments of the rearranged read pairs. For annotation of affected coding

**Table S3.1i. Predicted in-frame coding fusions\***

## CHAPTER 4:

### GENOMIC LANDSCAPES OF ENDOMETRIOID AND MUCINOUS OVARIAN CANCERS

## METHODS

### **Specimens obtained for sequencing analysis**

Matched tumor and normal tissue was collected from patients at time of resection. All tumor samples analyzed had  $\geq 20\%$  viable tumor cell content by histopathologic assessment. Clinical data for all patients included and sample data for the tissue types assayed in this study are listed in Table S1. All samples were obtained under Institutional Review Board (IRB) approved protocols with informed consent for research use at participating institutions.

### **Sample preparation and next-generation sequencing**

DNA was extracted from patient whole blood using a QIAamp DNA Blood Mini QIAcube Kit (Qiagen Valencia, CA). Genomic DNA from FFPE blocks was extracted from the microdissected tissues using the QIAamp DNA FFPE Tissue kit (Qiagen, Valencia, CA). In brief, the samples were incubated in proteinase K for 16 hours before DNA extraction. The digested mixture was transferred to a microtube for DNA fragmentation using the truXTRACT<sup>TM</sup> FFPE DNA Kit with 10 min shearing time as per the manufacturer's instructions (Covaris, Woburn, MA). Following fragmentation, the sample was further digested for 24 hours followed by one hour incubation at 80°C. DNA purification was performed using the QIAamp DNA FFPE Tissue kit following the manufacturer's instructions (Qiagen, Valencia, CA). Fragmented genomic DNA from tumor and normal samples were used for Illumina TruSeq library construction (Illumina, San Diego, CA) according to the manufacturer's instructions or as previously described<sup>11</sup>. Exonic or targeted regions were captured in solution using the Agilent SureSelect v.4 kit or a custom targeted panel according to the manufacturer's instructions (Agilent, Santa Clara, CA). Paired-end sequencing, resulting in 100 bases from each end of the fragments for exome libraries and 150 bases from each

end of the fragment for targeted libraries, was performed using Illumina HiSeq 2000/2500 and Illumina MiSeq instrumentation (Illumina, San Diego, CA).

### **Next generation sequencing data and identification of somatic mutations**

Somatic mutations were identified using VariantDx<sup>45</sup> custom software for identifying mutations in matched tumor and normal samples. Prior to mutation calling, primary processing of sequence data for both tumor and normal samples were performed using Illumina CASAVA software (v1.8), including masking of adapter sequences. Sequence reads were aligned against the human reference genome (version hg18 or hg19) using ELAND. Candidate somatic mutations, consisting of point mutations, insertions, and deletions were then identified using VariantDx across the either the whole exome or regions of interest<sup>44</sup>. For samples analyzed using targeted sequencing, we identified candidate mutations that were altered in >10% of distinct reads. For samples analyzed using whole exome sequencing, we identified candidate mutations that were altered in >10% of distinct reads with  $\geq 5$  altered reads in at least one sample, where coverage at the altered base was at least as high as the TP53 alteration in that sample, and where the ratio of the coverage of the mutated base to the overall sequence coverage of that sample was >20%. Identified mutations were reported as present in other samples of the same patient if the mutation was present in at least 2 distinct altered reads. Mutations present in polyN tract  $\geq 5$  bases, or those with an average distinct coverage below 50x were removed from the analysis.

An analysis of each candidate mutated region was performed using BLAT. For each mutation, 101 bases including 50 bases 5' and 3' flanking the mutated base was used as query sequence (<http://genome.ucsc.edu/cgi-bin/hgBlat>). Candidate mutations were removed from further analysis, if the analyzed region resulted in >1 BLAT hits with 90% identity over 70 SCORE

sequence length. All candidate alterations were examined by visual inspection, and any alteration present.

### **Structural variant analysis from whole genome sequencing data**

Structural variants were identified by modifying the trellis approach<sup>53</sup> for use with tumor samples with a matched normal sample available and integrating tumor purity and ploidy from FACETS.

#### *Tumor purity and ploidy estimation*

Tumor purity and ploidy were jointly estimated from each of 41 tumor-normal pairs using FACETS. These metrics were unable to be determined for four samples (PGDX3309T\_WGS\_Ex, PGDX4495T\_WGS, PGDX4500T2\_WGS, PGDX4500T3\_WGS) which were further excluded from CNV analyses.

#### *Generation of Segmented Log2 Ratios*

GC-adjusted log2 ratios were obtained as previously described in both tumor samples and normal samples. To remove technical biases and germline alterations, log2 ratios from matched normal samples were subtracted from log2 ratios in tumor samples. To identify genomic segments harboring abnormal copy number, the normalized log2 ratios were segmented using the circular binary segmentation method implemented in the R package and excluded from any structural variant analyses (PGDX3302T\_WGS\_Ex, PGDX3303T\_WGS\_Ex, PGDX3308T\_WGS\_Ex, CGOV365T).

#### *Generation of Integer Copy Number Estimates*

The log2 ratio ( $R$ ) for a segment  $i$  from a sample that is a mixture of normal and cancer cells are given by the following equation:

$$R_i = \log_2 \left( \frac{Ct_i \times p + Cn_i \times (1 - p)}{Pt \times p + Pn \times (1 - p)} \right)$$

Where  $p$  is the tumor purity,  $Ct_i$  is the number of copies of segment  $i$  in the tumor cells,  $Cn_i$  is the number of copies of segment  $i$  in the normal cells,  $Pt$  is the average ploidy of the tumor cells, and  $Pn$  is the average ploidy of the normal cells. Log2 ratios were converted to integer copy numbers for each genomic segment by solving the following equation for  $Ct$  and rounding to the nearest integer.

#### *Somatic Deletions*

The deletion analysis was restricted to segments less than 3 Mb where the integer copy number was either 0 or 1. At least 2 improper read pairs supporting the deletion were required to call a deletion hemizygous+ or homozygous+.

#### *Somatic Amplifications*

Using the trellis approach, amplicons were seeded with high-copy focal amplifications of greater than three times the average ploidy of the sample. Low copy gains with a copy number of greater than 1.5 times the average ploidy of the sample were linked to the seed if at least 2 read pairs supporting linking.

#### *Somatic Copy-Neutral Intra—and Inter-chromosomal Translocations and Inversions*

Somatic rearrangements were identified as previously described for each tumor sample and its matched normal sample. At least 2 improper read pairs and at least 1 split read was required to call a rearrangement. Rearrangements in tumor samples that overlapped any rearrangement identified in their matched normal samples were excluded.

#### *In-Frame Gene Fusions*

In-frame gene fusions were identified as previously described. Fusions where the left and right fusion partner were in the same gene, and also fusions where none of the exons in the three prime gene were predicted to be in the fusion protein were excluded.

### **Methylation Analysis**

We pre-processed and normalized raw IDAT files from the Infinium MethylationEPIC array using the funnorm function in the R package minfi<sup>69</sup>. Probes on chromosomes X or Y, probes with detection p value greater than 0.5, or probes overlapping a SNP with dbSNP minor allele frequency greater than 10% were excluded.

Unsupervised hierarchical clustering of the 1000 probes with the highest variance in the normal samples was performed. Next we performed penalized least squares logistic regression (PLR) with leave-one-out-cross-validation that identified five methylation sites predictive of normal ovarian or GI tissue type (area under receiver operator characteristic curve). We implemented the same leave-one-out resampling scheme to cross-validate the PLR model in the cancer samples, but restricted the training set to the five methylation sites that separated the tumor ovarian and GI tissues. We next performed this same analysis on the normal samples.

### **Signature Analysis**

Signature analysis was performed using the deconstructSigs package in R.

## RESULTS

### Overall approach

A total of 130 ovarian endometrioid, uterine endometrioid, ovarian mucinous, and GI mucinous tumors and matching normal tissues were collected from patients of four institutions in the US and Japan. A total of 13 ovarian or GI mucinous tumor samples had tumor cellularity below 20% and were excluded from further analyses. We performed genomic analyses of these matched tumor and normal samples to identify sequence, structural and epigenetic changes (Figure 4.1). All samples were analyzed by whole exome analyses (WES), and for the subset of cases where frozen tumors were available, we performed whole genome sequencing (WGS). Overall, we analyzed 84 tumors using WES and 33 tumors using WGS. The average coverage for WES and WGS was 221X per and 56X per sample, respectively (Table S4.2). We assessed substitutions, small insertions and deletions as well as copy number changes in samples with WES while samples with WGS were evaluated for these changes as well as for rearrangements, linked amplicons and gene fusions. Copy number analyses identifying both focal amplifications, deletions, as well as chromosomal gains and losses were performed for WES using Facets and for WGS using our recently developed Trellis approach<sup>53,112</sup>. We also used Trellis to evaluate linked amplicons that may be derived from an amplification of a single target gene that is connected to multiple different regions of the genome<sup>53,74,76,77</sup>.

### Ovarian endometrioid and uterine endometrioid cancers

We employed a highly sensitive mutation analysis to identify somatic alterations in ovarian endometrioid (n=36) and uterine endometrial (n=15) cancers. Consistent with previous analyses, we observed a bimodal distribution of the number of mutations for uterine endometrioid cancers, with nearly half of the 15 tumors analyzed having more than 500 mutations per exome<sup>47</sup>

(Supplementary Figure 4.1). In contrast, the probability of a hypermutator defect for ovarian endometrioid cancers was much lower, with only one patient out of 36 above this threshold.

Evaluation of the altered genes in ovarian endometrioid and uterine endometrioid cancers revealed similar affected pathways (Figure 4.2). Mutations involving chromatin regulating genes, and PI3K and RAS pathways were common in both tumor types. The proportion of patients with alterations in the *PTEN*, *PIK3CA*, *KRAS*, *PIK3R1*, *NF1*, and *ARID1A* genes were similar among these two cancer types and consistent with previous studies <sup>113,114</sup>. We also observed mutations in *TP53* and *CTNNB1* in ovarian endometrioid tumors as well as in uterine endometrioid cancers as has been previously described <sup>115</sup>.

We identified several mutations in driver genes among patients with ovarian endometrioid cancer that have not been previously reported, including the homologous recombination *RAD51C* gene, the Notch signaling genes, *NOTCH4* and *NOTCH1*, the chromatin remodeling genes *SMARCA4* and *SMARCA1*, the *E2F1* transcription factor, the *RET* receptor tyrosine kinase, and the *ABL1* kinase.

Surprisingly, we found that two of the eight non-hypermutator uterine endometrioid cancers had an identical *ESR1* hotspot mutation at Tyr537 (Y537C and Y537N) (Supplementary Figure 4.2). This hotspot has been reported in patients with breast cancer that have become resistant to tamoxifen or aromatase inhibitor therapy <sup>116,117</sup>. Although none of the patients in this study had been treated with these inhibitors, it is intriguing that these two women were over the age of 60 and had experienced menopause, resulting in an estrogen-free environment that may be similar to anti-estrogen therapy.

To understand the role of mutations in these ovarian cancer subtypes in the context of mutational signatures <sup>118</sup>, we evaluated the types of mutations and linked these to mutational processes that

include exogenous or endogenous mutagen exposure, enzymatic modification of DNA, and defective DNA repair (Supplemental Figure 4.3A). As expected, we found that the age-related mutation signature, Signature 1, was present in all samples, and also identified Signatures 6 or Signature 15 in patients with hypermutator defects.

We assessed both WES and WGS information for focal amplifications. For WGS data, we examined the read-pair information to pinpoint the presence of amplicons that may be linked genomically using the Trellis approach <sup>53</sup> (Figure 4.3A ). In addition to sequence alterations in *KRAS*, we found amplification of this gene in ovarian endometrioid cancer CGOV61T (Figure 4.2 and 4.3A). *KRAS* has been known to be amplified in ovarian endometrioid and HGSOc <sup>119</sup> and has been associated with an aggressive phenotype of metastatic uterine endometrial cancer <sup>120</sup>. We also identified linked amplification events involving *MYC* and *JAK1* (Figure 4.3). *MYC* amplification has previously been observed in a variety of ovarian cancers including endometrioid <sup>121</sup>. While *JAK1* amplification has been observed in triple negative breast cancer <sup>122</sup>, this gene has not been previously been reported to be amplified in ovarian endometrioid cancers.

We evaluated whole exome and genome sequence data for homozygous deletions and identified losses of the following genes that have been known to be altered in ovarian endometrioid cancers: *PTEN*, *NF1*, *GNAS*, *ARID1A*, *CCND1*, *BRCA1*, *RAD51C*, *PMS2*, *RET*, *ALK*, *SMAD3*, *TP53* and *ESR1*. Additionally, we identified deletions in *TSC2* and *STK11* that have not been previously reported in endometrioid ovarian cancer. *TSC2* deletions have been seen in high grade serous ovarian cancer <sup>123</sup> and mutations in *TSC2* have been associated with increased sensitivity to rapamycin-induced apoptosis, making *TSC2* a potentially targetable biomarker <sup>94</sup>. Germline *STK11* inactivating mutations have been associated with Peutz-Jeghers syndrome, and somatic changes in this gene have been reported in a variety of carcinomas including non-small cell lung carcinoma,

cervical cancer, colorectal cancer, melanoma, and pancreatic cancer with predominantly truncating mutations, but have not yet been reported in endometrioid ovarian cancer <sup>124</sup>.

For samples with available WGS, we also used Trellis to identify rearrangements and fusions (Supplementary Figure 4.4). These analyses revealed several novel rearrangements that were predicted to result in in-frame protein fusions in ovarian endometrioid cancers (examples in Figure 4.3B). *ATAD2-PTEN* was found in a patient with ovarian endometrioid cancer, CGOV172T. Interestingly, this rearrangement was associated with homozygous deletion of a portion of *PTEN* in this tumor. Rearrangements of *PTEN* associated with deletions have not been previously reported in ovarian endometrioid tumors and *PTEN* loss in the ovarian surface epithelium has been shown to induce papillary serous ovarian cancer<sup>123</sup>. Fusions involving the neurofibromin genes NF1 and NF2 (*NF1-RAB11FIP4* and *UBXN6-NF2*) were identified in ovarian endometrioid cancer CGOV161T. Although rearrangements involving NF1 and NF2 have been reported in other cancers <sup>53</sup> and have been associated with therapeutic resistance in HGSOC <sup>125</sup>, rearrangements of these genes have not been previously identified in this ovarian cancer subtype. We identified a novel fusion of *PPM1E-RAD51C* in patient CGOV172T with ovarian endometrioid cancer. Although the function of this rearrangement is unknown, germline alterations of *RAD51C* have been shown to increase the risk of breast and ovarian cancer<sup>126,127</sup>. Fusions of *IPO11-CDK7* and *PLK5-TCF3* were detected in two different tumors. *CDK7* is a member of the cyclin-dependent kinase family and involved in cell cycle progression and CDK7 inhibitors have been shown to exert broad cytotoxicity against ovarian tumors <sup>128</sup>. As the *IPO11* gene, involved in nuclear protein import, is expressed in both ovarian and endometrial cells, the fusion of *IPO11-CDK7* may lead *CDK7* to constitutively activated, promoting cell cycle progression and tumor growth. The polo like kinase 5 gene (*PLK5*) has been reported to be altered in glioblastoma <sup>129</sup> and along with other members of the PLK family may normally play a role in cell division and centriole duplication <sup>130</sup>. Increasing evidence suggests that aberrant expression of PLKs may affect cell division and play a

role in genomic instability<sup>131,132</sup> and may therefore be a useful target of therapeutic intervention<sup>133</sup>.

### **Ovarian mucinous and GI mucinous tumors**

We analyzed a total of 36 patients with ovarian mucinous carcinoma and with 14 colorectal mucinous cancers. Using a threshold of 500 mutations per exome, we identified two hypermutated tumors, including a mucinous colorectal tumor with a mutation in *POLE* (1/14) that had over 12,000 mutations per exome, and one ovarian mucinous tumor (1/36) with nearly 900 mutations (Figure 4). The hotspot somatic mutation observed in *POLE* occurred in the exonuclease domain of encoded protein and has been reported in a small subset of microsatellite-stable and hypermutated colorectal carcinomas, affecting the proofreading activity of the enzyme during DNA replication<sup>134</sup>.

Of the genes known to be altered through sequence changes in ovarian and colorectal mucinous tumors, we found alterations at similar frequencies in *KRAS*, *PIK3CA*, *RNF43*, *SMAD4*, *GNAS* and *TP53*. We identified several genes to be known mutated in ovarian mucinous cancers including *ERBB2*, *ARID1A*, *CCND1*, *CTNNB1*, *EGFR*, *CREBBP*, and *ATM*<sup>36,52,135,136</sup>. We also identified mutations in the chromatin modifier gene *SMARCA4* that had not been previously reported in ovarian mucinous cancers. None of these genes were found to be altered in colorectal mucinous cancers other than in the *POLE* mutant tumor. In addition to the age-related mutation Signature 1 which we found in nearly half in ovarian and GI mucinous cancers, we identified a signature associated with failure of DNA double-strand break-repair by homologous recombination Signature 3, which has been previously reported in breast, ovarian, and pancreatic cancers<sup>118</sup> (Supplemental Figure 4.3B).

Analyses of focal copy number changes revealed amplifications of *CCND1* and *ERBB2*, and homozygous deletions of *CDK2A/B* in mucinous ovarian cancers, a finding consistent with a previous studies<sup>53,137-139</sup>. Amplification of *ERBB2* was observed in six of the 36 ovarian mucinous cancers, and provides a potentially useful target for trastuzumab therapy<sup>140</sup>. *CDKN2A* deletions were observed in six cases, and an additional eight tumors had sequence alterations in this gene<sup>138</sup>. None of the colorectal mucinous tumors had copy number changes alterations in *ERBB2*, *CCND1* or *CDKN2A/B*.

Interestingly, homozygous deletions of *NFI* were present in both ovarian and colorectal mucinous tumors. In addition, we identified a novel rearrangement resulting in the likely inactivation of *NFI* (*NFI-RAD51D*) in one ovarian mucinous cancer. Inactivating alterations of *NFI* has been shown to lead to RAS overactivity in HGSOC<sup>12</sup>. Although the role of *RAD51D* is unclear in this context, it has been reported that germline *RAD51D* carriers are likely to develop ovarian tumors at an early age<sup>141</sup>. We also identified a novel *MED1-STAT5B* rearrangement in the same ovarian mucinous tumor. *MED1* alterations have been implicated in bladder and breast cancers and may be a potential target for treatment in endocrine resistant breast cancer<sup>142,143</sup>.

### **Integrative analyses**

To facilitate comparisons of the molecular alterations between the different tumor types, we integrated the sequence and structural changes at the gene level and organized these genes by biologically relevant pathways including Ras, PI3K, BRCA, WNT, chromatin regulating, cell cycle, TK receptors, DNA repair, and TGFBR (Figures 4.2 and 4.4). Genes observed to be commonly altered through this integrative analysis of sequence mutations, amplifications and deletions included *CDKN2A*, *ERBB2*, *CCND1*, *EGFR*, *PTEN*, *KRAS*, *NFI*, *ARID1A*, *BRCA1*, and *TP53*. For example, we found changes in cell cycle genes in 14/36 (38%) samples of ovarian

mucinous when combining mutations and deletions in *CDKN2A* and amplifications of *CCND1*. Likewise, combined analyses of the RAS pathway, including TK receptors, identified alterations in 30 of 36 (83%) of these tumors.

To assess whether cancer subtypes had differences in the molecular alterations that commonly arise in the development of these cancers, we implemented a Bayesian model averaging approach for feature selection using a logit link function<sup>102</sup>. This approach searches the space of  $2^{11}$  and  $2^{17}$ , respectively for the endometrioid and mucinous models, possible single- and multi-variate models using Markov Chain Monte Carlo, allowing for the simultaneous selection of features (genes) and estimation of effect size. Posterior summaries available from these models include the probability that the regression coefficient is non-zero (the proportion of models evaluated by MCMC that included the gene) and the posterior median and 90% credible interval of the odds ratio. For the ovarian endometrioid and uterine endometrioid subtypes, we did not find statistically significant differences in the genes/pathways that were altered in these cancers (Figure 4.5A). However, for the ovarian and GI mucinous cancers, we found that *CDKN2A* were more commonly altered in the ovarian mucinous tumors (Figure 5B). These analyses revealed statistically significant differences between the number of alterations among the cell cycle and TK receptor pathways, and suggested that ovarian mucinous and GI mucinous tumors may evolve differently.

### **Methylation Analyses**

Given the mutational differences observed, we hypothesized that ovarian and GI mucinous cancers may also be epigenetically distinct. To evaluate this possibility, we performed genome-wide methylation analyses of the GI and mucinous cancers as well as their matched normal tissues using Infinium MethylationEPIC arrays that interrogated more than 850,000 CpG sites. Methylation levels were evaluated for a subset of 25 mucinous tumor samples and matched normal samples with

sufficient material at individual CpG sites within gene promoter regions ( $\pm 1500$  bp upstream of the transcription start site) or within individual genes. After normalization, we estimated the proportion of methylated CpG sites as the fraction of CpG probes with Beta > 0.3. Overall methylation was higher among normal samples and more variable in cancer (Supplemental Figure 3).

Unsupervised hierarchical clustering of the 1000 probes with the highest variance in the normal samples revealed a clear separation of the normal ovarian and GI tissues (Figure 4.6A) that was present but less pronounced in the cancer tissues (Figure 4.6B). Penalized least squares logistic regression (PLR) with leave-one-out-cross-validation identified five methylation sites predictive of normal ovarian or GI tissue type (area under receiver operator characteristic curve). Given the large range of tumor purity of the biopsied cancers (20-80%), we hypothesized that these methylation sites would not be predictive of the histopathological diagnosis if the tumors shared the same tissue of origin. To evaluate this hypothesis, we implemented the same leave-one-out resampling scheme to cross-validate the PLR model in the cancer samples, but restricted the training set to the five methylation sites that separated the tumor ovarian and GI tissues (Figure 4.6C). Applied to the mucinous cancers, the tumor-specific tissue methylation sites predicted the histopathological cancer diagnosis with a sensitivity of 100% at a specificity of 100% (AUC 1.0, 95% CI: 0.86-1.0). Additionally, we used the same leave-one-out resampling scheme to cross validate the PLR model among the cancer samples, but restricted the training set to five methylation sites that separated the normal ovarian and GI tissues. Applied to the mucinous cancers, the tissue-specific methylation sites predicted the histopathological cancer diagnosis with a sensitivity of 83% at a specificity of 77% (AUC 0.8, 95% CI : 0.59-0.93), indicating that these cancers likely have a distinct tissue of origin (Figure 4.6D). We found no relationship between tumor purity and the classifier performance, suggesting that our approach was robust to normal contamination.

**Figure 4.1. Overview of genomic analyses**

We performed genomic analyses of these matched tumor and normal samples to identify sequence, structural and epigenetic changes

**Figure 4.2. Integrated genomic and epigenomic analyses of ovarian endometrioid and uterine endometrial cancers**

Integrated somatic point mutations, structural variants including linked amplicons, deletions and rearrangements ordered by pathway. Panels within each tile plot starting from the top represent tumor purity, number of each type of alteration, the panel of alterations present in each sample color coded based on type and finally the mutation spectra.

**Figure 4.3. Whole genome analyses of linked amplicons and rearrangements**

A) Circos plots for three tumor samples with >100 structural variants(left) each contained linked amplicons(right) with focal amplifications of known driver genes indicated by triangles. Circos plots of 19 tumor samples with few structural variants. Circos plots depict copy number alterations as well as intra- and inter-chromosomal rearrangements. Segmented normalized estimates of read depth were used to identify candidate focal amplifications in yellow and focal deletions in green. Rearranged read pairs and split reads were used to identify inter- and intra-chromosomal rearrangements in blue. For these amplicon graphs nodes represent genes, node size represents number of times the segment is represented in the genome, color indicates the chromosome the segment is located on and edges represent how the segments are connected in the genome. B) Reads aligned to the fusion junction of two representative rearrangements. Split reads, that span the fusion junction in black, and read pairs, that reside on either side of the junction in green and blue, give evidence for identifying such rearrangements.

**Figure 4.4. Integrated genomic analyses of ovarian and colorectal mucinous cancers**

Integrated somatic point mutations, structural variants including linked amplicons, deletions and rearrangements ordered by pathway. Panels within each tile plot starting from the top represent tumor purity, number of each type of alteration, the panel of alterations present in each sample color coded based on type and finally the mutation spectra.

**Figure 4.5. Prevalence of alterations in related tumor types.**

Bayesian model averaging was used to identify alterations involving known drivers associated with ovarian and uterine endometrioid tumors(A) or ovarian and GI mucinous tumors (B). The probability that the gene coefficient ( $\gamma$ ) in these models is non-zero is indicated by a bar graph (left). The inter-quartile range (IQR) for the difference in log odds of the regression coefficient is indicated by error bars (right). The odds of a mutation in ERBB2 and CDKN2A were higher among patients with GI mucinous cancers compared to patients with ovarian mucinous cancers.

**Supplemental Figure 4.1. Distribution number of mutations within the endometrioid samples**  
 Count of samples represented in the bar graph either uterine endometrial (blue) or ovarian endometrioid (red) with density curve as a black line and the cut off of hypermutators at 500 mutations on a square-root scale.

#### Supplemental Figure 4.2. ESR1 Y537R mutations

ESR1 mutations found in three uterine endometrioid cancer patients at Tyr357 hotspot most commonly associated with aromatase inhibitor resistance in breast cancer patients. This hotspot is located in close proximity to the region of the estrogen receptor that is important for ligand-dependent transcriptional function. The Tyr537 mutations cause a conformational change that constitutively activates the receptor independent of ER binding. Below is the conformational structure of ESR1 with Tyr537 highlighted in purple.

### Supplemental Figure 4.3. Mutation signature analyses

Mutation signature analyses for various tumor types. Color indicates the percentage for which the signature explains the overall mutational profile of that sample.

**Supplemental Figure 4.4. Circos plots of 19 ovarian endometrioid tumor samples**  
Circos plots depict copy number alterations as well as intra- and inter-chromosomal rearrangements. Segmented normalized estimates of read depth were used to identify candidate focal amplifications in yellow and focal deletions in green. Rearranged read pairs and split reads were used to identify inter- and intra-chromosomal rearrangements in blue.

**Supplemental Figure 4.6. Comparison of mutation frequencies in ovarian mucinous and endometrioid tumors**

Bayesian model averaging was used to identify alterations involving known drivers associated with endometrioid and ovarian mucinous tumors. The probability that the gene coefficient ( $\gamma$ ) in these models is non-zero is indicated by a bar graph (left). The inter-quartile range (IQR) for the difference in log odds of the regression coefficient is indicated by error bars (right). The odds of a mutation in ERBB2 and CDKN2A were higher among patients with GI mucinous cancers compared to patients with ovarian mucinous cancers.

**Supplemental Figure 4.7. Proportion of methylated probes in mucinous tumor samples**

The proportion of methylated CpG sites (mean B > 0.3) in the mucinous stomach samples, mucinous pancreas samples and mucinous ovarian samples for tumors and their matched normals.

CHAPTER 5:

DISCUSSION

## 5.1 High grade serous ovarian carcinomas originate in the fallopian tube discussion

These results provide a comprehensive evolutionary analysis of sporadic high-grade serous ovarian carcinoma in five patients. Given the unique nature of the multiple samples we examined from each patient, our study may have certain limitations not typical of genome-wide efforts. First, the small size of the tumor samples compared to surrounding non-neoplastic tissue could potentially lead to low tumor purity. The high mutant allele fraction of *TP53* among cancer samples (average of 56-85%) indicates that this issue was largely overcome through laser capture microdissection. Second, the small number of cells in p53 signature samples may have limited our genomic analyses for these lesions. The observation that all sequence changes in p53 signatures were also present in STIC and other carcinomas of multiple sites is consistent with our evolutionary model and suggests that these cells are likely to represent a parental clone of other neoplastic lesions. Third, our analysis was limited to ovarian cancers where STICs and other concomitant lesions were identified, and may therefore not be representative of all HGOs. The absence of STIC lesions in ~40% of sporadic HGSOCs is likely due to an incomplete sampling of the fallopian tube or the overgrowth of the STIC by the carcinoma in the context of bulky disease, but may also reflect another site of origin that has yet to be determined for these cancers<sup>144</sup>. Fourth, this study did not intend to address the intra-tumoral heterogeneity within the carcinomas but rather focused on clonal changes within each tumor. Fifth, as in any evolutionary analyses, the genomic alterations we observed provide the most likely model of tumor development but do not exclude the possibility of other relationships. Nevertheless, our analyses of somatic alterations suggest that models where the ovarian cancer or metastatic lesions seed the fallopian tube tumors<sup>25,26</sup> (including STICs or p53 signatures) are infrequent and unlikely to be the source of most fallopian tube lesions.

Despite these potential limitations, the data we have obtained provide new insights into the etiology of ovarian Type II carcinoma and have significant implications for the prevention, early detection and therapeutic intervention of this disease. The results suggest that ovarian cancer is a disease of

the fallopian tubes, with the development of p53 signatures and STICs as early events. The subsequent formation of a cancer in the ovaries represents a seeding event from a primary tumor in the fallopian tube that already contains sequence and structural alterations in key driver genes, including those in *TP53*, PI3K pathway, and *BRCA1/BRCA2* genes. The recurrent allelic imbalances observed in chromosomes 1, 6, 16, 18, 20 and 22 may suggest additional genes that involved in this process. The timing of the progression from STICs to ovarian cancer in the cases we analyzed was on average 6.5 years, but seeding of metastatic lesions in these patients occurred rapidly thereafter. This timing is consistent with recent reports showing a difference of 7.7 years in the age of *BRCA* carriers with localized vs advanced adnexal lesions<sup>145</sup>. This evolutionary timeline can help explain why most HGSOC patients are diagnosed at advanced stage (III/IV) with pelvic and peritoneal spread of disease, and why among asymptomatic *BRCA* germline mutation carriers half of the cases diagnosed with asymptomatic adnexal neoplasia have already seeded to pelvis or peritoneum (>IA)<sup>145</sup>. These observations are largely similar to other genomic analyses of the evolution of ovarian cancer<sup>24,25,28,146</sup> as well as the recent analyses of STIC lesions that were reported while this study was under review<sup>14</sup>. Our study highlights the role of p53 signatures as early lesions in this evolutionary paradigm.

Our genomic analyses are consistent with population-based studies of the effects of salpingectomy on the risk of ovarian cancer. Prophylactic bilateral salpingo-oophorectomy has been shown to reduce the risk of developing ovarian cancer in *BRCA* mutation carriers to below 5%<sup>147,148</sup>. Likewise, bilateral salpingectomy, performed as a contraceptive method instead of tubal sterilization, reduced the risk of ovarian cancer by 61% at 10 years<sup>149</sup>. Our study provides a mechanistic basis for these observations and has implications for clinical management in prevention of ovarian cancer. In high risk *BRCA* carriers, bilateral salpingectomy with delayed oophorectomy should be considered<sup>150</sup> through participation in ongoing clinical trials (NCT02321228; NCT01907789). In non-carriers, our work implies that for women who undergo

surgery for benign uterine causes, total abdominal hysterectomy and bilateral salpingectomy with sparing of the ovaries should be considered<sup>151</sup>, and that bilateral salpingectomy may be a preferred contraceptive alternative to tubal ligation. The dual concepts in these recommendations for *BRCA* carriers and non-carriers are that removal of the fallopian tubes (rather than the ovaries) may be curative as it eliminates the underlying cellular precursors of ovarian cancer, and that preservation of the ovaries provides long term benefits due to decreased risk and fatalities from coronary heart disease and other illnesses<sup>152</sup>. A limitation of this approach is that as the precise timing of when potentially malignant cells shed from the fallopian tube and microscopically seed the ovary is unknown, removal of the tubes may not provide optimal risk-reduction.

## **5.2 Integrated genomic, epigenomic and expression analyses of ovarian cancer cell lines discussion**

These analyses provide the most comprehensive molecular analyses of ovarian cancer cell lines to date. Through integration of sequence, copy number, rearrangement, methylation, and expression analyses, we were able to detect frequently altered driver genes and pathways. These efforts revealed that ovarian cancer cell lines were largely representative of primary ovarian cancers and identified a variety of alterations not previously appreciated in these tumors.

One of the challenges of genomic analyses of tumor cell lines has been the lack of matched normal samples for determination of whether alterations are truly tumor-specific. Through the development of Trellis, we were able to identify high-confidence copy number and rearrangement alterations in the absence of matched normal DNA. Additionally, the grouping of structural changes allowed linking of apparently disparate events that would normally have been considered separate copy number alterations. These efforts provide a method for detecting somatic structural changes in cancer cell lines and other specimens in the absence of a matched normal, without the hundreds to

thousands of false-positive changes typically detected through other approaches. The method also permits identification of likely driver copy number changes by detecting the most connected regions of amplicons among the many such passenger alterations typically observed in human cancers. The identification of likely somatic structural and sequence alterations in a tumor-only setting is conservative. Cancer signature analyses, for example, currently require a matched normal sample to comprehensively identify somatic signatures across the genome, and our analyses based on a subset of somatic alterations may not reflect overall somatic mutation signatures.

These efforts revealed alterations in ovarian cancer that may provide insights into the biology of this disease. The integration of methylation and expression changes together with sequence and structural changes identified a larger fraction of tumors that were altered in specific genes and pathways than whole-genome sequencing alone. For example, CDKN2A was altered in over half of the serous, clear-cell, and mucinous cancer cell lines analyzed, revealing a higher fraction than previously thought to have alterations in this gene. Additionally, changes of a variety of genes, including ASXL1, H3F3B, and CDC73, as well as fusions of YAP1-MAML2, IKFZ2-ERBB4, and those disrupting FBXW7, NF1, and CCND1 were detected in these tumors, providing pathways of dysregulation within ovarian cancer.

The integrative molecular analyses of ovarian cancer cell lines provide opportunities for characterizing differences in susceptibility to targeted therapies. As an example, ovarian tumors with sequence alterations in PIK3CA and PPP2R1A had enhanced sensitivity to the GNE-493 inhibitor to achieve the same therapeutic response as tumors without these alterations. Mutations in PIK3CA and PPP2R1A are common in ovarian clear-cell cancers, suggesting that PI3K inhibitors may be an effective therapeutic strategy for this subtype.

Cancers with HRD are more prone to genomic errors resulting in loss or duplication of chromosomal regions and chromosomal instability<sup>73</sup>. Drugs that inhibit PARP1 cause multiple double strand breaks, and in tumors with HRD such DNA damage cannot be efficiently repaired, leading to cell death. We found that serous and endometrioid tumors with MYC amplification were highly sensitive to PARP inhibitors. PARP inhibitors have been previously shown to lead to mitotic catastrophe in neuroblastoma with amplification of the related gene MYCN on chromosome 2p<sup>153</sup>, and MYC amplification on chromosome 8q has been shown to suppress BIN1, thereby increasing the activity of PARP1<sup>154</sup>. Additionally, MYCN amplified neuroblastoma cell lines were more sensitive to the PARP inhibitor BYK204165 compared to cell lines without such alterations<sup>155</sup>. In our study, MYC was the central driver in multiple ovarian cancers cell lines with highly linked amplicon groups (Table S1g; Figures S3, S4, and S5), suggesting that this gene plays a major role in a subset of ovarian cancers that may now be targeted therapeutically. Interestingly, we found that genome-wide rearrangements were a more useful biomarker of sensitivity to this therapy compared to the commonly used HRD scores<sup>156-158</sup>, perhaps because these latter measurements only identify a subset of patients that respond to PARP inhibitors, especially as shown in clinical trials that enriched for tumors with previous sensitivity to DNA-damaging agents<sup>159,160</sup>. Although there is a correlation between the HRD score and the number of inversions and intra-chromosomal rearrangements (Spearman correlation coefficient = 0.5), the genome-wide rearrangements we identified may provide a more informative signature of the underlying recombination deficiency in these tumors and together with MYC amplification offer potentially improved opportunities for identifying responsive patients.

### **5.3 Genomic landscapes of endometrioid and mucinous ovarian cancers discussion**

These analyses provide an extensive genomic and epigenomic analysis of ovarian mucinous and endometrioid cancers. Through the integration of somatic mutations, structural variants, including

deletions, linked amplicons, intra and inter-chromosomal rearrangements, as well as methylation analyses, we were able to detect frequently altered genes and pathways that describe the genomic landscape of these tumor types. These efforts revealed that ovarian endometrioid and uterine endometrial cancers were genetically similar, suggesting they may share a common cellular precursor. In contrast, at both genetic and epigenetic levels, ovarian and GI mucinous tumors had different characteristics, highlighting the unique origins of these tumors.

We identified novel alterations that have not been previously observed in these tumors. These included alterations in *RAD51C*, *NOTCH4*, *SMARCA4*, *SMARCA1* and *JAK1* in ovarian endometrioid, and *SMARCA4* genes in ovarian mucinous cancers. Whole genome sequence analyses using our Trellis pipeline revealed novel rearrangements involving *PTEN*, *NF1*, and *NF2* in ovarian endometrioid tumors, and *NF1* and *MED1* in ovarian mucinous cancers. Many of these novel alterations provide new avenues for potential therapeutic intervention or new insights into the biology of these cancers. For example, patients with germline *NF1* mutations have shown to respond well to MEK1/2 inhibitors, providing a new treatment avenue for tumors with alterations in this gene <sup>161</sup>. *SMARCA4* loss, while not directly targetable, may result in cyclin D1 deficiency leading to susceptibility to CDK4/6 inhibition and thus provide another targetable treatment avenue to patients with *SMARCA4* mutant ovarian endometrioid tumors <sup>162</sup>. *JAK1* is essential for IL-6-class inflammatory cytokine signaling and plays a critical role in metastatic cancer progression in breast cancer, and may provide a similar role in ovarian endometrioid cancer <sup>163</sup>. *MED1* is a tissue-specific coactivator of the estrogen receptor that mediates breast cancer metastasis and treatment resistance <sup>164</sup> and when targeted in model systems results in reduced growth and metastasis of breast cancer xenografts <sup>165</sup>. *MED1* rearrangements involving exons may lead to overexpression of this protein that could be exploited in ovarian mucinous cancer patients.

In uterine endometrioid cancers, we identified *ESR1* activating mutations in three of 15 patients at amino acid residue 537 resulting in a mutation hotspot commonly seen in breast cancer patients who have become resistant to estrogen targeted therapies. Although aromatase inhibitors have been shown to select for Tyr537 *ESR1* mutations<sup>116,117</sup>, none of the patients in this study had been treated with these therapies. We hypothesize that these three women, each over the age of 60, may have been in a post-menopausal estrogen-free environment similar to estrogen therapy that increased selection for *ESR1* mutations. The significant interest in overcoming *ESR1* mutations for patients with resistance to aromatase inhibitors may ultimately provide new avenues for patients with these *de novo* alterations in uterine endometrioid cancers.

#### 5.4 Overall Discussion

Our observations also have implications for improved detection of ovarian cancer. Unfortunately, less than 1.25% of HGSOE are confined to the ovary at diagnosis<sup>27</sup>. Earlier detection of this disease is likely to benefit from the identification of a precursor lesion, as has been the case for many other tumor types. Our data suggest that fallopian tube neoplasia is the origin of ovarian serous carcinogenesis, and can directly lead to cancer of the ovaries and of other sites. Currently, the typical histopathologic evaluation of fallopian tubes typically involves a cursory evaluation of one or two representative sections. Our study suggests that systematic sectioning and extensive examination of total fallopian tubes<sup>21</sup> should become common practice in pathology, and not confined to academic tertiary care centers. Depending on whether the fallopian tubes are removed for benign conditions, risk-reducing bilateral salpingectomy, or gynecological cancers, specific examination protocols should be applied<sup>21,166</sup>. Given the window of time that appears to exist between the formation of fallopian tube lesions and development of ovarian cancer, these insights open the prospect of novel approaches for screening. Such approaches may be especially important given the limited therapeutic options currently available for ovarian cancer<sup>4,5</sup>. Recent advances for

ultrasensitive detection of genetic alterations in blood-based liquid biopsies, pap smears, and other bodily fluids<sup>167 168</sup> or imaging approaches may provide opportunities in early diagnosis and intervention.

Although our analyses provide a comprehensive integration of molecular alterations for ovarian cancer, certain types of changes have not been evaluated. In the future, proteomic, metabolomic, and carbohydrate changes can be added to the compendium of genomic, epigenomic, and transcriptomic information for these cell lines. Additionally, further efforts will be needed to demonstrate that these observations can be translated broadly to ovarian cancer patients.

Nevertheless, these data provide a foundation for using ovarian cell line models in screening novel therapeutic strategies. Evaluation of additional compounds using these well-characterized tumor cell lines will provide rational translational opportunities for development of new therapies in ovarian cancer.

Integrated analyses of the sequence and structural changes through Bayesian modeling revealed that the genomic landscapes of ovarian GI mucinous tumors were different, but that ovarian endometrioid and uterine endometrial tumors were related and may share similar origins. Our observation that ovarian and uterine endometrioid tumors may share a similar cellular precursor is consistent with previous observations of co-occurrence of these diseases at a higher than expected frequency based on the individual prevalence of these cancers. The common origin of these tumors remains to be determined, but accumulating evidence that that other ovarian cancers such as HGSOC arise in the fallopian tube<sup>13</sup>, together with pathologic evidence suggests that the endometrium is the likely source of this cancer. These observations have important implications for the management of these patients and may suggest new methods for disease prevention.

## CURRICULUM VITAE

### DOROTHY LEIGH HALLBERG

Johns Hopkins University School of Medicine  
The Sydney Kimmel Comprehensive Cancer Center  
The Koch Cancer Research Building  
1550 Orleans Street  
CRB2 Room 532  
Baltimore, Maryland 21287  
P: 410-614-4631  
dhallbe2@jhmi.edu  
DOB: 09/17/91 Mt.Kisco, NY

### EDUCATION

- 2014 – Present **Human Genetics PhD Candidate**  
Johns Hopkins School of Medicine, Baltimore, Maryland  
Advisor: Victor E. Velculescu M.D, Ph.D.
- 2013 –2014 **Oncology Master of Science by Research**  
Oxford University, Oxford, England  
Advisor: Sir Walter Bodmer Ph.D.
- 2009 –2013 **Anthropology and Biology BS**  
Bucknell University, Lewisburg, Pennsylvania

### RESEARCH EXPERIENCE

- 2014 – Present **Graduate Research Assistant, Johns Hopkins School of Medicine, Baltimore, Maryland**  
Project: Spearheaded efforts to understand the evolution of high grade serous ovarian cancer and the genomic landscapes of many subtypes of rare ovarian cancer.
- Co-developed bioinformatics software, Trellis, to identify structural alterations in tumor only ovarian cancer samples.
  - Research validated the origin of high grade serous ovarian carcinoma in the fallopian tube (2016, *Cancer Genomics*)
  - Write research summary and contribute research strategy content for annual American Medical Resources Foundation Adelson grant renewal
  - Trained both a new postdoc and a younger graduate student in the lab in next generation sequencing techniques and analysis
- 2013 – 2014 **Graduate Research Assistant, Oxford University, Oxford, England.**  
Project: Utilized flow cytometry and cell culture to understand the differentiation of goblet cells in colorectal cancer
- Designed independent experiments to understand the pathway of differentiation of goblet cells in colorectal cancer cell lines.
- 2012-2013 **Undergraduate Research Assistant, Bucknell University**  
Advisor: Dr Ken Field, FTIs and Burkitt's Lymphoma

**2012 Summer Research Intern, Mt. Sinai Hospital.**  
Advisor: Dr. Shu-hsai Chen

### TEACHING EXPERIENCE

2015 TA for Pathology Biology  
2015-2016 TA for Introduction into Bioinformatics  
2018 TA for 4 day intensive Practical Genomics Workshop

### LEADERSHIP EXPERIENCE

2014-2016 Captain of Soccer Team  
2012-2013 Global Ambassador for IFSA-Butler  
2011-2012 Senior Coxswain for St. Catherine's Boat Club at Oxford University  
2010-2011 Rowing Coach at Norwalk River Rowing Association

### PUBLICATIONS:

Dutke, T., **Hallberg, D.** and Reeves, R.H. (2014) Chronic up-regulation of the SHH pathway normalizes some developmental effects of trisomy in Ts65Dn mice. *Mechanisms of Development* 135
